# Statistical tables and charts

## List of tables

<i>Table</i>		<i>Page</i>
1.1	Summary of UK fishing industry: 1996 to 2005	3
2.1	UK fishing vessels by Department of Administration: 1996 to 2005	8
2.2a	Main activity of the UK fishing fleet, by segment: 2004 to 2005	9
2.2b	The size of the UK fishing fleet: 1996 to 2005	9
2.3	UK over 10m fleet by licensing district: 2003 to 2005	10
2.4	UK fleet by vessel length: 2005	11
2.5a	Age of UK vessels (over 10m): 2005	14
2.5b	Age of UK vessels (10m and under): 2005	18
2.6	Fish Producer Organisation (FPO) membership: 2005 to 2006	22
2.7	Number of fishermen: 1938 to 2005	23
2.8	Number of fishermen by district: 2004 to 2005	24
3.1a	Landings into the UK and abroad by UK vessels: 2001 to 2005	32
3.1b	Percentage of landings into the UK and abroad by UK vessels: 2001 to 2005	33
3.2	Landings into the UK by UK and foreign vessels: 1938 to 2005	34
3.3	Landings into the UK and abroad by UK and foreign vessels: 2001 to 2005	35
3.4a	Landings into major ports in England and Wales by UK vessels: 2005	43
3.4b	Landings into major ports in Scotland by UK vessels: 2005	49
3.5	Landings into UK ports by UK vessels: 2001 to 2005	52
3.6	Landings into the UK by foreign vessels: 2005	56
3.7	Landings abroad by UK vessels: 2005	59
3.8	Landings into the UK and abroad by UK vessels by area of capture: 2005	62
3.9	Landings into the UK by UK vessels – by month of landing: 2005	67
4.1	Balance Sheet for the UK: 1996 to 2005	72
4.2	Imports of fish and fish preparations into the UK: 2004 to 2005	76
4.3	Exports of fish and fish preparations from the UK: 2004 to 2005	79
4.4	Imports of fish and fish preparations into the UK by exporting country: 2004 to 2005	82
4.5	Exports of fish and fish preparations from the UK by importing country: 2004 to 2005	88
4.6	Imports of fish products into the UK: 2004 to 2005	94
4.7	Exports of fish products from the UK: 2004 to 2005	96
4.8	Household purchases in the UK: 1999 to 2005	98
4.9	Household purchases in the UK: 1950 to 1990	98
4.10	Average annual prices of fish: 1938 to 2005	99
5.1	Main stocks and their status: 2001 to 2005	107
5.2	Spawning stock biomass and recruitment by stock over the period for which the assessments are available: 1946 to 2004	109
6.1	European Union fishing fleet by vessel length: 31 December 2005	118
6.2	Total Allowable Catches, quotas and uptake (%): 2005	120
7.1	World catch by nationality of vessel: 1999 to 2004	141
7.2	World catch by sea area: 1998 to 2004	144

## List of charts

<i>Chart</i>		<i>Page</i>
2.1	Main ports (England and Wales) and landing districts (Scotland)	7
3.1	Quantity and value of landings into the UK and abroad by UK vessels by Department of Administration: 2001 to 2005	25
3.2	Landings into the UK and abroad by UK vessels: 2001 to 2005	26
3.3	Demersal landings into the UK and abroad by UK vessels: 2001 to 2005	27
3.4	Percentage of cod and haddock landed by UK vessels by area of capture: 2005	27
3.5	Percentage of mackerel and herring landed by UK vessels by area of capture: 2005	28
3.6	Percentage of crabs and nephrops landed by UK vessels by area of capture: 2005	29
3.7	ICES fishing areas around the UK coastline	30
4.1	International trade of fish: 1996 to 2005	69
4.2	Total fish available for domestic use in the UK: 1996 to 2005	69
4.3	Quantity of demersal and pelagic fish and fish preparations imported into the UK and exported from the UK: 2005	70
6.1	European fleet by nationality of vessel: 31 December 2005	117
7.1	Major FAO fishing areas	140

# Preface

The UK Sea Fisheries Statistics are intended to provide a broad picture of the UK fishing industry and its operations. A note on the methodology used in this publication appears in Appendix 2. The content of this publication is also available on the MFA website [www.mfa.gov.uk](http://www.mfa.gov.uk).

We recommend that you refer to the explanatory notes and glossary of terms which are important in interpreting some of the data.

If you have any comments on this publication or would like more detailed information, please contact:

# Explanatory notes

1. The tables refer, as far as possible, to the United Kingdom, including the Isle of Man and the Channel Islands, with separate figures for England and Wales, Scotland and Northern Ireland. In some cases figures for the various parts of the United Kingdom are not strictly comparable and differences are explained in the headings and footnotes of the tables.
2. The figures in the tables in Chapter 3 and 4 for catches and landings are given in terms of liveweight.
3. Landings by foreign vessels into the UK include landings by fishing vessels and carriers (if first point of sale of fish). Total imports which combine landings by fishing vessels, carriers and cargo vessels are shown in Tables 4.2, 4.4 and 4.6.
4. Landing figures include a quantity caught by British vessels but not actually landed at British ports. These quantities are transhipped to foreign vessels in coastal waters and are later recorded as exports.
5. The following symbols apply throughout:
  - means "nil"
  - .. means "negligible" (less than half the last digit shown)
  - nd means "no data available"
  - na means "not applicable"
6. Difficulties in collecting complete statistics on shellfish landings mean that available figures may significantly underestimate the total landings in some instances. The figures are however thought to be broadly indicative of trends.

# 1 Overview of the UK fishing industry

## 1.1 The UK fishing industry

In 2005 the fishing industry in the UK had 6,341 fishing vessels, with a further 381 vessels registered in the Channel Islands and the Isle of Man. Some 708 thousand tonnes of sea fish were landed into the UK and abroad by the UK fleet with a total value of £571 million. In addition the UK imported some £1,686 million of fish. The UK also exported fish and fish products to the value of £925 million. The UK has a substantial fish processing industry of around 573 businesses, which employ some 18,180 people. At the retail level there were approximately 1.3 thousand fishmongers in the year 2005, including mobile fish vans and market stalls. 85 per cent in volume and 80 per cent in value of chilled and frozen products were sold through supermarkets. This does not include canned produce. Fish is also consumed in restaurants and in take away form from fish and chip shops. A small proportion of the catch is used to make fish oils and animal feeds. Some of the species caught by UK fishing vessels find a better market abroad and these species are usually exported or landed directly abroad. In 2005, UK vessels landed directly into non-UK ports 216 thousand tonnes of sea fish with a value of £115 million.

## 1.2 Administration of the UK fishing industry

Fisheries Administrations in the UK are comprised of the Department for Environment, Food, and Rural Affairs (Defra) and the Marine Fisheries Agency (MFA), the Scottish Executive Environment & Rural Affairs Department (SEERAD), the National Assembly for Wales Agriculture Department (NAWAD), and the Department of Agriculture and Rural Development for Northern Ireland (DARD). Departments in the Isle of Man, Jersey and Guernsey are responsible for administering fishing activity in their respective areas.

## 1.3 The Common Fisheries Policy

The primary aim of the Common Fisheries Policy (CFP) is to ensure rational and sustainable exploitation of fish stocks through conservation and management policies designed to protect resources and reflect the needs of the fishing industry. Structural policies are aimed at improving the balance between catching capacity and available resources by addressing fishing effort. Conservation policies are aimed at regulating the quantities of fish caught, through a system of Total Allowable Catches (TACs) based on scientific advice. These TACs are allocated as quotas to EU Member States in accordance with fixed keys based on historic fishing rights. They are complemented by a series of technical conservation measures intended to achieve more selective fishing, for example by setting rules on minimum landing sizes, minimum mesh sizes and gear design, as well as defining areas of seasonal closures, methods of fishing and target species. Opportunities to fish in third country waters are also secured through the CFP.

#### **1.4 Fish Producer Organisations**

Fish Producer Organisations (FPOs) are established under the CFP to enable groups of fishermen to market the fish they catch. In 1985 FPOs were given the opportunity to manage allocations of some whitefish stocks subject to TAC restrictions in the North Sea (Area IV) and West of Scotland (Area VI). In 1991 this opportunity was extended to TAC whitefish stocks in the English Channel and Western waters (Area VII). Since 1995, FPOs wishing to manage quota allocations for whitefish stocks in Areas IV, VI and VII have been required to do so for all such stocks; a similar requirement for pelagic stocks was introduced in 1999. Allowing FPOs to take on this management responsibility enables them to plan their uptake of their particular allocations to optimise the benefit to their members. In 2005 there were 19 FPOs in the UK, and in addition there were also four other groups with separate allocations; the 10 metre and under fleet, the non-sector, the Isle of Man non-sector and the Lunar Group which manages its own allocations for pelagic stocks. Furthermore from 1 January 2003 FPOs have had the opportunity to manage allocations for deep sea stocks.

#### **1.5 Sea Fisheries Committees**

There are twelve Sea Fisheries Committees (SFCs) which regulate local sea fisheries around virtually the entire coast of England and Wales out to 6 miles. In addition, the Environment Agency acts as an SFC covering certain estuaries. SFCs were established in the 19th century and are empowered to make by-laws for the management and conservation of their districts' fisheries. In 1995 their powers were widened to include the control of fisheries in their districts for environmental reasons.

#### **1.6 Statistics for managing fisheries**

Prior to 1984, all UK catch statistics were provided to the Fisheries Administrations on a voluntary basis. Since that year the regulations of the CFP have required those UK vessels which account for most of the fish caught to provide to the Sea Fisheries Inspectorates of the respective Fisheries Administrations, located at the main ports, information on each trip including the main species caught, the area of capture, and the quantities landed. Additional information is collected to complete, as far as possible, the coverage of fishery activity. The combined data provide the main source of catch and landings statistics for UK vessels as recorded in the tables in this publication. (For further information regarding the statistical methodology see Appendix 2 of this publication).

The catch and landings statistics provide a system for monitoring the uptake of the UK share of stocks for which annual TACs are set. In any year once the quota has been taken the fishery is closed.

Information on the fishing fleet is obtained from the Register of Shipping and Seamen, part of the Maritime and Coast Guard Agency which is an executive agency of the Department for Transport.

Source:- Fisheries Administrations in the UK, H.M. Customs and Excise, Expenditure and Food Survey, Office for National Statistics

- (a) GDP for fishing includes landings abroad.  
 (b) Year-on-year comparisons may be affected by changes in the industrial classification of some contributors. For most businesses data are appropriate to a single activity heading; where information covers a mixture of activities, the business is classified according to the main activity.  
 (c) The number of vessels excludes those registered in the Channel Islands and Isle of Man.  
 (d) Figures for 1999 to 2004 have been revised following a correction to an error found when producing aggregate results from sample data.  
 (e) The quantity of landed fish is expressed in terms of liveweight. The figures relate to landings both into the UK and abroad.  
 (f) Imports are valued at cost, including insurance and freight terms whereas exports are valued at free on board terms.  
 (g) Data are derived from the National Food Survey prior to 2001, and from the Expenditure and Food Survey for 2001 onwards. Figures for 2001 onwards are based on financial year data.  
 (h) Including non-alcoholic beverages.  
 (i) The landed price index has been calculated on an annual basis with 1987 = 100  
 (j) The fish component of the RPI which includes canned and processed fish. The Index is calculated on a monthly basis with January 1987 = 100

## 2 The structure of the UK fishing industry

### 2.1 Introduction

Statistics on the UK fishing fleet since 1990 have been based on the fleet of fishing vessels as registered with the Register of Shipping and Seamen, part of the Maritime and Coast Guard Agency which is an executive agency of the Department for Transport. Information provided by the Registry includes the length (overall and registered), breadth, gross tonnage, power, age and material of construction. Information on the fishing fleets of the Isle of Man, Guernsey and Jersey are supplied by the respective registering authorities. Prior to 1990, the statistics were based on fishing vessels known by Departments to be active.

Statistics on the size of the UK fishing fleet are complicated by the fact that the European Union has been progressively altering the methodology used to determine vessel tonnage for the fishing fleet from various national and international standards, previously collectively called GRT, to a common standard based on the International Tonnage Convention 1969 (ITC69) and known as Gross Tonnage (GT). A phased programme of re-measurement was introduced in the UK in 1996 which was completed by the early part of 2004.

Vessel tonnage is a volumetric measure, but there is no simple relationship between the various types of GRT and GT. For any given vessel, a GT figure can only be obtained by physical measurement or, in the case of smaller vessels, by using formulae provided by the EU designed to give an approximation. GT figures are often higher than GRT figures for the same vessel; the range of outcomes can be as low as 50 per cent or as high as 300 per cent of the original tonnage depending on the individual vessel characteristics; for large vessels, GT is almost always higher than GRT.

Licensing of vessels first applied in 1977 and covered only fishing vessels over 40 feet (12.14 metres) in certain fisheries. Following the adoption of the European Union's Common Fisheries Policy, the UK designated a number of fish stocks as pressure stocks and introduced a restrictive licensing scheme for vessels fishing those stocks. The licensing regime initially only covered vessels over 10 metres registered length, but its coverage has been progressively extended over the years. In February 1990 the licensing regime was extended to vessels of over 10 metres overall length fishing for TAC stocks. Later the same year restrictive licensing was extended to cover all fishing by vessels over 10 metres overall length with the exception of those fishing for salmon and migratory trout which were covered by a separate regime. From May 1993 licensing was extended to vessels of 10 metres and under overall length.

For statistical purposes a fishing vessel is attributed to the port and the corresponding Fisheries Administration that issues its licence. In Tables 2.4 and 2.5, a number of vessels were unattributed to any Department; these include vessels which are currently registered but which do not hold a licence.

Table 2.4 has been revised to include information on the location of 10m and under UK fishing vessels around the UK coast. Similarly, Table 2.5b has been introduced to provide a corresponding age breakdown for 10m and under vessels.

## **2.2 Fleet structure, Multi-Annual Guidance Programmes and the Fleet Entry:Exit Regime**

The Multi-Annual Guidance Programmes of the CFP provide a framework for bringing fleet capacity across the EU in line with the available fishing opportunities. The fourth such programme covering the years 1997-2001 was agreed in 1997, and extended to run until the end of 2002. As with previous plans, each member state's fleet was subdivided into segments. Capacity (in terms of total tonnages and engine power) or effort reduction targets were set for each of these segments, with the targets being tailored to the particular circumstances of each member state's fleet. In the UK these segments were based on the recorded activity of fishing vessels, with each vessel attributed to a segment on the basis of the fishing activity it carries out most often.

Table 2.2a shows the development in vessel numbers, tonnage and engine power in 2005 compared with the situation in 2004. Table 2.2b shows the size of the UK fishing fleet as a whole since 1996. The series for GT\* (see appendix 1) reflects vessels which had remeasured to ITC69 by the end of 2003.

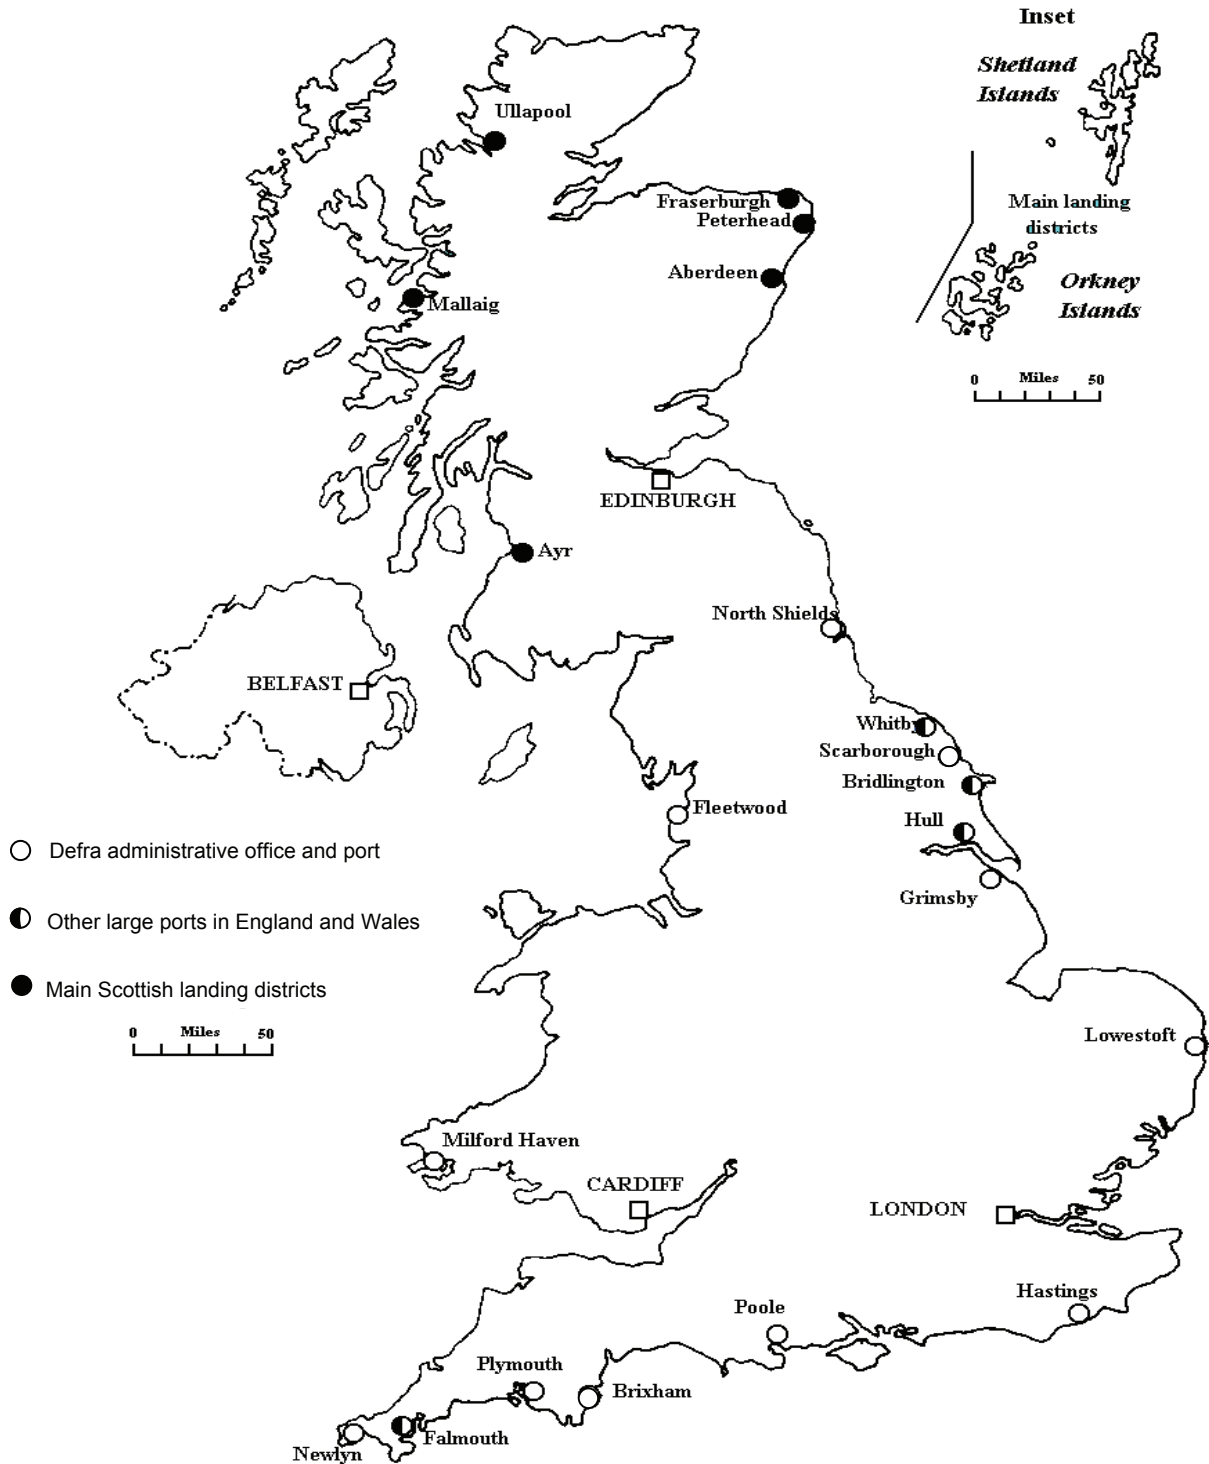

As part of the review of the CFP carried out by the Commission and member states during 2002, it was agreed that the MAGP would be replaced by an Entry:Exit regime. The aim of this regime is to limit the level of fleet entries to ensure that they are matched by fleet exits where appropriate. The exact rules for the implementation of this regime across the EU were finalised during 2003. While a ceiling for the total capacity in tonnage and in engine power for the UK fleet still exists, individual targets for fleet segments are no longer set. Therefore the changes in the levels of tonnage and engine power for the fleet segments as at the end of 2004 and 2005 in Table 2.2a do not give rise to any breach of objectives. The EU Entry:Exit regime in fact is very similar to the existing licensing regime in the UK, which prevents the creation of new fishing capacity as any new vessel must obtain a licence to fish from existing vessels. The UK licensing regime also prevents a significant movement of capacity between segments.

## **2.3 Number of fishermen**

Statistics on the number of fishermen are drawn from surveys carried out by the Marine Fisheries Agency in England and Wales, by the Sea Fisheries Inspectorate in Northern Ireland and by the Sea Fisheries Protection Agency in Scotland. Overall, the number of fishermen continues to decrease.

Estimates for employment in the England and Wales catching sector for 1999 to 2004 have been revised following a review of the methodology used to produce the aggregate estimates of employment from the sample data received from MFA coastal offices. Whilst leading to significant revisions in the aggregate estimates of employment in the catching sector in England and Wales, the downward trend present in the previous data is still present in the revised statistics.

**Chart 2.1 Main ports (England and Wales) and landing districts (Scotland)**

**TABLE 2.1 UK fishing vessels by Department of Administration: 1996 to 2005**

Numbers and tonnage as at 31 December of each year		1996	1997	1998	1999	2000	2001	2002	2003	2004	2005

Source:- RSS and Fisheries Administrations in the UK

(a) Since fishing vessels can be registered under various Shipping Acts, the registered tonnage figures are not strictly comparable.

(b) The figures for England, Wales and Northern Ireland include vessels not allocated to any department.

(c) Data from the end of 2003 onwards for the Islands fleets are on a revised basis - historic data will be provided as soon as available.

**TABLE 2.2a Main activity of the UK fishing fleet, by segment: 2004 to 2005 <sup>(1)</sup>**

(1) With effect from 31 December 2002, the last phase of the EU Fishing Fleet Multi Annual Guidance Programme ended. From then on Member States have not had to operate limits for their fleet segments. As a consequence, segmentation of the fleet for MAGP purposes is no longer carried out, hence the introduction of an "unknown" segmentation group.

**TABLE 2.2b The size of the UK fishing fleet: 1996 to 2005 <sup>(a)</sup>**

At year end:-

	Number	GT* <sup>(b)</sup>	Power (kW) <sup>(c)</sup>
1996	8,667	274,532	1,054,927
1997	8,458	272,421	1,026,542
1998	8,271	270,644	1,006,071

- (a) Prior to 1952 figures were based on information supplied by the Registrar General of Shipping and Seamen. Since 1952 figures have been supplied by the District Fishery Officers of Defray.
- (b) From 1966 these figures exclude 'hobby' fishermen, i.e. fishermen who do not fish commercially. The corresponding figures for Scotland and Northern Ireland have never included 'hobby' fishermen.
- (c) Includes 1986 figures for Newly and Plymouth.
- (d) The apparent increase in fishermen in Scotland reflected the licensing of 10m & under vessels; when more information became available on the numbers of such active vessels.
- (e) Figures for England and Wales have been revised following a review of the methodology used to produce the aggregate estimates of employment from the sample data received from MFA coastal offices. Whilst leading to significant revisions in the aggregate estimates of employment in the catching sector in England and Wales, the downwards trend present in the previous data is still present.

(a) Figures for England and Wales have been revised following a review of the methodology used to produce the aggregate estimates of employment from the sample data received from MFA coastal offices. Whilst leading to significant revisions in the aggregate estimates of employment in the catching sector in England and Wales, the downwards trend present in the previous data is still present.

### 3 Catches and landings data

#### 3.1 Summary

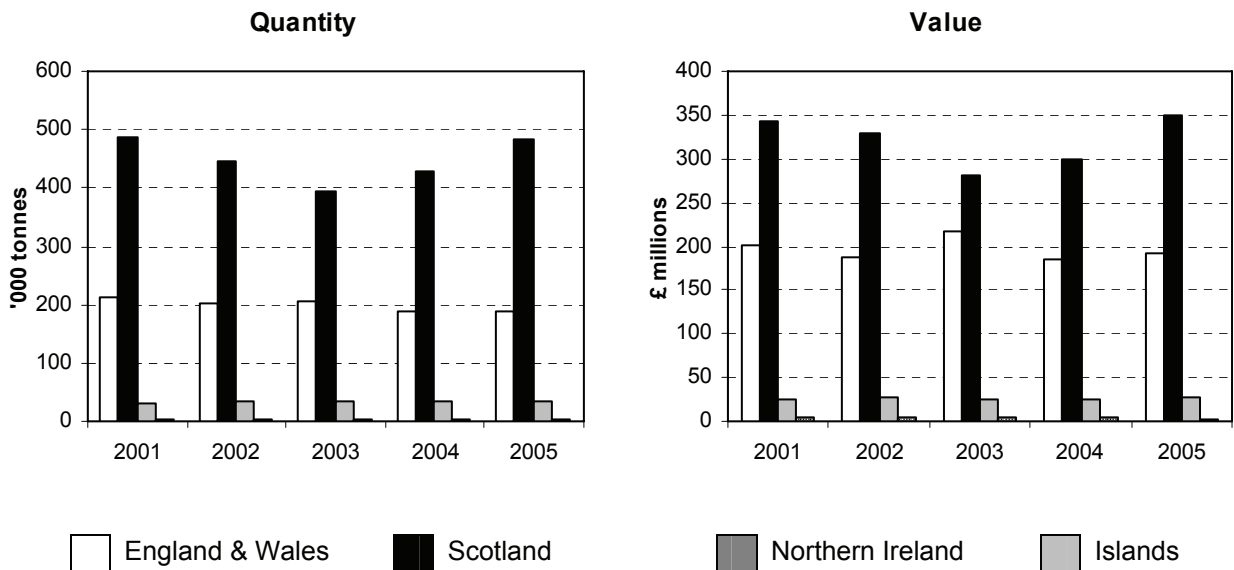

This chapter brings together the information available for quantity, value, species and area of capture by UK vessels landing into the UK and abroad and foreign vessels landing into the UK. The landings data are given in terms of live weight.

In 2005, UK vessels, including the Channel Islands and Isle of Man vessels, landed in the UK and abroad 708 thousand tonnes of sea fish (including shellfish) with a value of £571 million. Compared with 2004, this represents an 8 per cent increase in quantity and an 11 per cent increase in value.

Around 69 per cent of fish taken by the UK fleet were landed in the UK, the remainder being landed at ports abroad. In terms of value, 80 per cent of UK vessel landings were made in the UK.

Vessels with Departments of Administration in Scotland accounted for 68 per cent of the weight and 61 per cent of the value of landings by UK vessels. English and Welsh vessels accounted for 27 per cent of the quantity and 34 per cent of the value of the landings, while Northern Ireland vessels represented 5 per cent by quantity and value. An alternative representation of landings by department of administration can be seen in Chart 3.1.

**Chart 3.1 Quantity and value of landings into the UK and abroad by UK vessels by Department of Administration: 2001 to 2005**

In 2005, 61 per cent of all landings by UK vessels were caught in two areas: Northern North Sea - Area IVa (224 thousand tonnes) and West of Scotland - Area VIa (208 thousand tonnes).

### 3.2 UK landings

Landings by UK vessels into the UK have risen to 492 thousand tonnes from 462 thousand tonnes in 2004. Demersal species represented 32 per cent of total landings in terms of quantity and 38 per cent in terms of value. Pelagic species accounted for 43 per cent of landings by quantity but only 22 per cent by value. Shellfish accounted for 25 per cent of landings by quantity and 40 per cent by value. In 2005, 24 per cent of all UK landings by UK vessels were landed in Peterhead and 22 per cent were landed in Lerwick.

Landings by UK vessels into the UK and abroad are shown in Chart 3.2.

**Chart 3.2 Landings into the UK and abroad by UK vessels: 2001 to 2005**

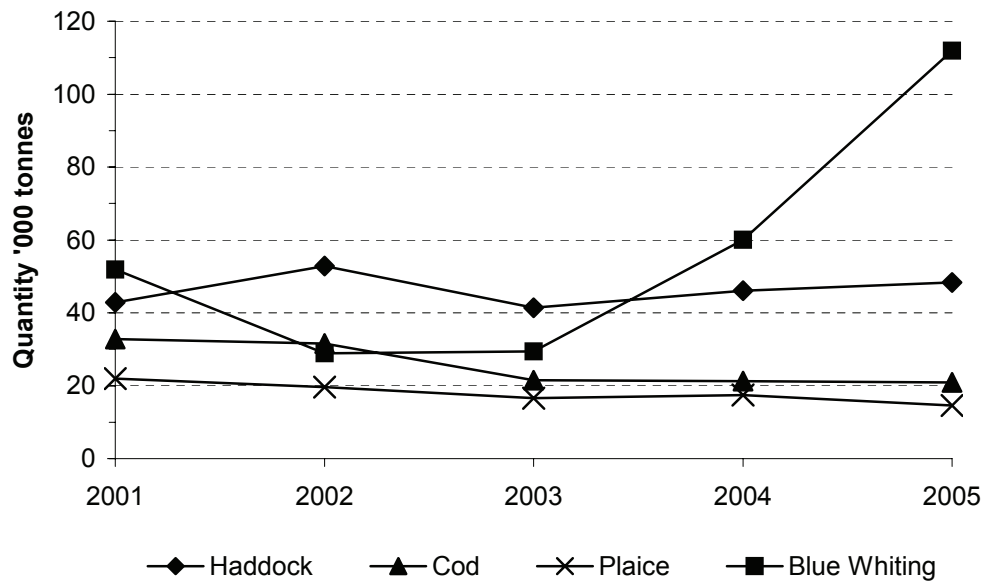

#### 3.2.1 Demersal fish

In 2005, 112 thousand tonnes of blue whiting were landed by UK vessels into the UK and abroad, an increase of 86 per cent on 2004. These landings accounted for 40 per cent of all demersal landings but only 3 per cent of the value.

Landings of cod have decreased by more than a third since 2001 and haddock landings have increased by 13 per cent (Chart 3.3). A more detailed species breakdown of demersal landings in the UK by both UK and foreign vessels and of landings abroad by UK vessels can be found in Table 3.3.

Of the 21 thousand tonnes of cod landed by UK vessels into the UK and abroad in 2005, 31 per cent (6 thousand tonnes) were caught in the Northern North Sea - Area IVa.

**Chart 3.3 Demersal landings into the UK and abroad by UK vessels: 2001 to 2005**

Of the 48 thousand tonnes of haddock landed by UK vessels in 2005, 74 per cent (36 thousand tonnes) were caught in the Northern North Sea – Area IVa (see Chart 3.4 for a breakdown by area).

**Chart 3.4 Percentage of cod and haddock landed by UK vessels by area of capture: 2005**

### 3.2.2 Pelagic fish

Mackerel and herring are the two main pelagic species landed by UK vessels into the UK and abroad accounting for 94 per cent, by weight, of the total pelagic landings in 2005. Landings of herring have increased by 55 per cent since 2001, while landings of mackerel have fallen by 22 per cent. In 2005, mackerel landings were valued at £104 million, 18 per cent of the total for all sea fish (including shellfish). A more detailed species breakdown of pelagic landings in the UK by both UK and foreign vessels and of landings abroad by the UK fleet can be found in Table 3.3.

Of the 126 thousand tonnes of herring landed by UK vessels in 2005, 73 per cent (92 thousand tonnes) were caught in the Northern North Sea - Area IVa and 15 per cent (19 thousand tonnes) were caught in the West of Scotland - Area VIa.

Of the 155 thousand tonnes of mackerel landed by UK vessels into the UK and abroad in 2005, 64 per cent (100 thousand tonnes) were caught in the West of Scotland - Area VIa and 25 per cent (39 thousand tonnes) in the Northern North Sea - Area IVa (see Chart 3.5 for a breakdown by area).

**Chart 3.5 Percentage of mackerel and herring landed by UK vessels by area of capture: 2005**

### 3.2.3 Shellfish

The two main species (by weight) of shellfish landed by UK vessels into the UK and abroad are crabs and nephrops. In 2005, nephrops accounted for 26 per cent of shellfish landings and crabs accounted for 17 per cent. Landings of nephrops have increased by 20 per cent since 2001 while landings of crabs have decreased by 16 per cent. These two species accounted for 56 per cent of the total shellfish value and scallops accounted for 16 per cent. A more detailed species breakdown of shellfish landings in the UK by both UK and foreign vessels and of landings abroad by UK vessels can be found in Table 3.3.

Of the 23 thousand tonnes of crabs landed by UK vessels into the UK and abroad in 2005, 32 per cent (7 thousand tonnes) were caught in the West of Scotland - Area VIa, 19 per cent (4 thousand tonnes) were caught in the Central North Sea - Area IVb and 18 per cent (4 thousand tonnes) were caught in the English Channel – Area VIIId/e.

Of the 34 thousand tonnes of nephrops landed by UK vessels in 2005, 36 per cent (12 thousand tonnes) were caught in the Northern North Sea - Area IVa and 30 per cent (10 thousand tonnes) were caught in the West Of Scotland - Area VIa (see Chart 3.6 for a breakdown by area).

**Chart 3.6 Percentage of crabs and nephrops landed by UK vessels by area of capture: 2005**

# 4 Supplies, overseas trade and marketing

This chapter brings together the information on the fish available for consumption, imports, exports, prices and household consumption. The landings data are given in terms of landed weight. The trade data are shown in terms of actual product weight.

## 4.1 Partial Balance Sheet for the UK

Chart 4.1 shows a partial balance sheet for the UK. Details are given in Table 4.1 - separate tables are given for demersal, pelagic and shellfish, and within these groupings, for particular species. In aggregate terms, the UK has been a net importer of fish throughout the period 1996 - 2005.

**Chart 4.1 International trade of fish: 1996 to 2005**

**Chart 4.2 Total fish available for domestic use in the UK: 1996 to 2005**

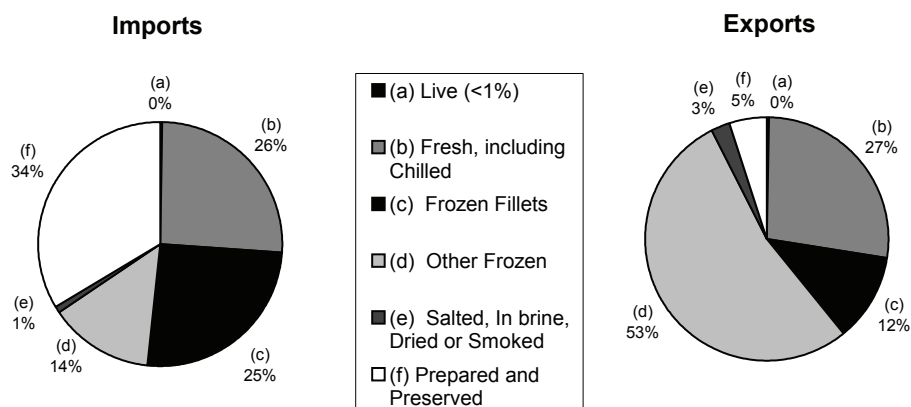

Chart 4.2 shows that landings by UK vessels into the UK fell from 594 thousand tonnes landed weight in 1996 to 437 thousand tonnes in 2001. Since 2001 landings have risen to 475 thousand tonnes in 2005. More detailed landings data can be found in Chapter 3. Adding the crude trade gap to the landings, and taking into account stock changes, gives us a figure for the total available for domestic (UK) use. The crude trade gap was under 100 thousand tonnes in 1993 and 1994, but has since increased to around 250 thousand tonnes.

## 4.2 Imports

Total imports of fish and fish preparations have increased from 533 thousand tonnes in 1996 to 717 thousand tonnes in 2005. In terms of value, total imports rose to £1,686 million in 2005, 14 per cent higher than in 2004.

Demersal and pelagic fish and fish products accounted for 84 per cent of total imports by weight and 75 per cent of total imports by value in 2005. Prepared and preserved fish accounted for 34 per cent of total demersal and pelagic fish and fish products imported into the UK by weight; frozen fillets for 25 per cent; other frozen products for 14 per cent and fresh, including chilled, for 26 per cent. More detailed breakdown of both quantity and value of imports can be found in Table 4.2.

**Chart 4.3 Quantity of demersal and pelagic fish and fish preparations imported into the UK and exported from the UK: 2005**

In 2005, the UK imported 202 thousand tonnes of prepared or preserved demersal and pelagic fish. Of this, 102 thousand tonnes were tuna, and a further 25 thousand tonnes were salmon. The highest quantities of prepared or preserved demersal and pelagic fish were imported (in descending order of quantity) from the Seychelles, Mauritius and Thailand. Further information on the country of origin of UK imports can be found in Table 4.4.

In 2005 the UK imported over 21 thousand tonnes of fresh or chilled cod and 31 thousand tonnes of fresh or chilled haddock. In addition 79 thousand tonnes of frozen cod fillets and 31 thousand tonnes of other frozen cod were imported.

The main types of shellfish imported into the UK in 2005 were shrimps and prawns, of which 43 thousand tonnes were imported in the form of fresh, chilled, frozen or semi-preserved. The main type of prepared or preserved shellfish were also shrimps and prawns, with 47 thousand tonnes imported.

In total in 2005, the UK imported 18 thousand tonnes of shellfish from Iceland, 11 thousand tonnes from Denmark and from India and 9 thousand tonnes from Bangladesh.

### **4.3 Exports**

In 2005, total exports of fish and fish preparations fell by 4 per cent to 458 thousand tonnes but total value rose by 4 per cent to £925 million.

In 2005, demersal and pelagic fish and fish products accounted for 78 per cent of total exports by weight and 62 per cent by value. Fresh, including chilled fish, accounted for 27 per cent of total demersal and pelagic fish and fish products exported from the UK by weight. Frozen fillets accounted for 12 per cent, other frozen products for 53 per cent and prepared and preserved products for 5 per cent of demersal and pelagic fish exports. A more detailed breakdown of both quantity and value of exports can be found in Table 4.3.

In 2005, the UK exported 97 thousand tonnes of fresh demersal and pelagic fish (including chilled). Of this total, 41 thousand tonnes were salmon.

In 2005, the UK exported 103 thousand tonnes of shellfish and shellfish preparations. Of this, 27 thousand tonnes were to Spain and 24 thousand tonnes were to France.

### **4.4 Prices**

The average annual prices quoted in this publication are based on realisations for first-hand sales of fish to all outlets, i.e. for human consumption and for other uses such as fish meal and animal feeding stuffs. These prices are calculated using the equivalent live weight. In 2005 the average annual price of fish was £928 per tonne. This is a 6 per cent increase on 2004. In 2005, the average annual price for demersal fish increased by 4 per cent to £1,103 per tonne; the price of pelagic fish increased by 7 per cent to £318 per tonne; and the total shellfish price increased by 8 per cent to £1,476 per tonne. A more detailed breakdown of the prices for individual species for selected years can be found in Table 4.10.

(a) 2005 data on imports are provisional

(b) Fillets are expressed in terms of product weight. Excludes herring, salmon and trout

(c) Includes pelagic fish other than herring, which are not separately identifiable

(d) Large amounts of salmon and trout are imported as prepared and preserved fish (See Table 4.2)

(e) Includes those member states joining the European Union on 1 May 2004

(f) Includes live fish not previously identified

(a) Fillets are expressed in terms of product weight. Excludes herring, salmon and trout.

(b) Includes pelagic fish other than herring, which are not separately identifiable.

(c) Includes those countries joining the European Union on 1 May 2004.

(d) Includes live fish not previously identified.

- (a) Data for the years 1938 to 1987 were originally calculated on a standard landed weight basis. These data have been converted to a liveweight basis for comparison purposes; however they should not be regarded as showing the accurate liveweight price but may be used to indicate trends
- (b) Average values for the UK not available. Landings in Scotland of the species in the years indicated were included with "Other Demersal" or "Other Shellfish".
- (c) Prior to 1972 landings of Scallops and Queens were not separately identifiable and were entered under one heading of Scallops.

# 5 Main stocks and their level of exploitation

By Dr Carl M. O'Brien, Senior Fisheries Science Advisor at Cefas

## 5.1 The management of stocks

Fisheries are managed using a Total Allowable Catch or TAC (corresponding to a particular harvesting rate), and technical measures (mainly mesh sizes and minimum landing sizes, but sometimes closed areas, which determine the smallest fish that can be caught and landed) based on scientific advice.

In the EU, the TAC is set each year by the Council of Ministers following negotiations on catch options that are provided by the Advisory Committee on Fishery Management (ACFM) of the International Council for the Exploration of the Sea (ICES), an independent scientific body. For the main North Sea stocks these options take into account the terms of a management agreement between the EU and Norway. Once a TAC is agreed for each stock and fishing area it is allocated as quotas to Member States in accordance with fixed keys based on historic fishing rights.

In recent years, some seriously depleted stocks have become the subject of emergency measures and recovery plan proposals. Since 2003, the TAC and fishing mortality implemented for these stocks has been linked to effort control measures that restrict the number of fishing days at sea per month permitted for fleets capturing recovery species.

## 5.2 Scientific assessment and advice

ICES advice is based on stock assessments carried out at international working groups, where fishery scientists from the UK and the other exploiting nations compile fisheries data, biological data and survey data for use in fisheries science models. The age structure of a stock (the relative proportion of the different age groups) is largely determined by the fishing rate and by the numbers of young fish that enter the stock each year. When information on age structure is combined with data on landings, fishing effort, and the results of standardised stock surveys carried out by research vessels, the models are able to estimate the historical trend in fishing rate and stock abundance, up to the last full year of data. The assessment is then used to forecast the expected catch in an upcoming TAC year for a range of fishing rate options, taking into account the number of young fish that are expected to enter the stock, based either on survey data, or a recent historical average.

Scientists describe the state of the stocks in terms of the spawning stock biomass (SSB, the weight of mature fish), the fishing rate (F), and the number of juvenile fish or recruits in each year-class (see Appendix 1 for definitions of these terms). Since 1999 the ICES advice has identified which catch options meet precautionary criteria. These criteria aim to ensure sustainability by keeping spawning biomass above a minimum

precautionary level,  $B_{pa}$  (set high enough to allow a margin of error sufficient to keep SSB above a lower limit level,  $B_{lim}$ ), and keeping the fishing rate below a maximum precautionary level,  $F_{pa}$  (set low enough to allow a margin of error sufficient to keep  $F$  below an upper limit level,  $F_{lim}$ ).  $B_{lim}$  is therefore below  $B_{pa}$ , and  $F_{lim}$  is above  $F_{pa}$ .

The following section summarises the present state of the main stocks based on advice from the ACFM meetings of May and October 2005, which evaluated stock assessments using fisheries data for years up to and including 2004, and survey data up to and including 2005. The 2005 ACFM advice formed the basis for the EU proposals that led to the TACs and other measures agreed for 2006 by the EU Council of Ministers.

Full details are contained within Council Regulation (EC) No 51/2006 of 22 December 2005 fixing for 2006 the fishing opportunities and associated conditions for certain fish stocks and groups of fish stocks, applicable in Community waters and, for Community vessels, in waters where catch limitations are required.

### **5.3 The state of the main stocks**

The main North Sea roundfish stocks are those for *cod*, *haddock*, *whiting* and *saithe*, whose landings have all declined since their high point in the 1970s and/or 1980s.

#### **5.3.1 North Sea roundfish**

The *cod* stock remains seriously depleted. The international fishing rate has been high since the 1980s, reaching a historic high in 1999. The SSB fell to a historic low in 2001. The number of young cod (recruitment) has been low since 1987, and even lower since 1998, causing serious concern. Since 2000, ICES advised that the TAC should be very low, or zero, and the EU reduced the TAC from 81,000 tonnes in 2000 to 48,600 tonnes in 2001, 49,300 tonnes in 2002, and 27,300 tonnes in 2003, 2004 and 2005. The minimum mesh size in the directed fisheries for cod, haddock and whiting was also increased to 120mm in 2003. The 2005 ICES assessment indicates that the 2001-2004 year-classes are all well below the average. In 2004, agreement was reached within the EU on a formal recovery plan that was operational during the TAC and management decision processes of 2004, effectively rendering the plan operational in 2005. The EU TAC for 2006 is set at 23,205 tonnes.

For *haddock*, the fishing rate has fluctuated at a high level since the 1970s, and SSB has fluctuated around the precautionary biomass, depending on the variation in recruitment. The 2005 assessment shows that haddock fishing mortality has declined sharply from the high point, and that SSB has increased due to the outstanding 1999 year-class, which is now being replaced by poorer year-classes. The haddock TAC was set at 77,000 tonnes for 2004, 66,000 tonnes for 2005 and 51,850 tonnes for 2006.

The status of *whiting* is unknown. Different data sources give conflicting information on the development of this stock. Total catches (landings and discards combined) have been gradually decreasing since 1976 but

the whiting TAC is 23,800 tonnes for 2006 – a decrease from 28,000 tonnes in 2005.

For *saithe*, fished mainly in the northern North Sea, the fishing rate has been falling since the 1980s, and the stock has been increasing since 1992, and it is now above the precautionary level. However, the perceived increase in the stock in recent years estimated in the 2005 assessment is lower than that estimated in the 2004 assessment, so that the TAC for 2006 has been reduced to 123,250 tonnes, compared with 145,000 tonnes in 2005 and 190,000 tonnes in 2004.

### 5.3.2 North Sea flatfish

The main stocks are the plaice and the sole. The *plaice* assessments in 2004 and 2005 include estimates of discards, which have increased in recent years. This has changed the perception of the plaice stock relative to precautionary levels. It shows landings and SSB falling steeply after 1990 as the fishing rate increased to a peak in 1997, with SSB currently close to a historic low and below  $B_{pa}$ , yet above  $B_{lim}$  (previously estimated well below this level), and with the fishing rate remaining high. A recovery plan for North Sea plaice is currently under development within the European Commission. The TAC for 2006 is 57,441 tonnes, compared with 59,000 tonnes in 2005 and 61,000 tonnes in 2004. Discarding of small plaice continues to be a problem. In *sole*, the fishing rate has fluctuated well above the precautionary level, but periodic good year-classes have raised SSB above the precautionary level from time to time. SSB is currently above the precautionary level, and the fishing rate is declining, so the TAC agreed for 2006 is 17,670 tonnes compared with 18,600 tonnes in 2005 and 17,000 tonnes in 2004.

### 5.3.3 North Sea herring and mackerel

The North Sea *herring* stock, which collapsed in the 1970s and was closed to fishing for several years, subsequently recovered, and although it fell back in the mid-1990s, it has again been rehabilitated. SSB is now well above the precautionary level due to a moderate fishing rate on both juvenile and adult herring, coupled with two strong year-classes in 1998 and 2000. However, all year-classes since 2001 are among the weakest since the late 1970s. The TAC in 2006 is 454,751 tonnes compared with 535,000 tonnes in 2005 and 460,000 tonnes in 2004. In contrast, the North Sea *mackerel* stock has never recovered from the collapse of the 1970s, and the fishery remains closed.

### 5.3.4 English Channel flatfish

*Sole* stocks in the eastern and western Channel are biologically discrete stocks that are assessed and managed separately. In the larger, eastern Channel stock, the assessed fishing rate has been decreasing, and SSB has increased above the precautionary level, and the TAC for 2006 is 5,720 tonnes, compared with 5,700 tonnes in 2005 and 5,900 tonnes in 2004. In the smaller western Channel stock, the 2005 assessment is somewhat uncertain, but it indicates that the fishing rate has remained close to the historical high, and that SSB has declined towards the lower limit,  $B_{lim}$ . ICES therefore advised a recovery plan, but an EU proposal has yet to be agreed. The EU set a TAC of 940 tonnes for 2006 – higher than the TACs set in 2005 and 2004 of 865 tonnes and 300 tonnes, respectively. The *plaice* stock in the eastern Channel is linked to that in

the southern North Sea but is separate from the western Channel. In the eastern Channel, the state of the plaice stock can no longer be assessed due to a divergence between the landings-at-age and survey-based indices. In the western Channel the fishing rate in 2005 reached its maximum historical level, and the SSB is below the precautionary level. Following ICES advice in 2005, the combined eastern and western Channel plaice TAC for 2006 is 5,151 tonnes, the same as in 2005, compared with 6,060 tonnes in 2004.

### 5.3.5 Westerly anglerfish and megrim

The two *anglerfish* species ('black' and 'white') are caught together, but the main catches are of the species *Lophius piscatorius*. SSB has remained consistently above the precautionary level since the mid 1990s, and appears set to continue to increase in the short-term owing to recent very good recruitment. The fishing rate has fluctuated around a declining trend but is now just above the precautionary level. The 2005 ICES advice is to reduce the fishing rate on both species to the precautionary level, but given the recent good recruitment and subsequent increase in SSB, the 2006 TAC for ICES Subarea VII and Divisions VIIIa,b,d,e was set at 33,918 tonnes, compared with 31,202 tonnes in 2005. The area VII share of the 2006 TAC is 26,456 tonnes.

For *Megrim*, landings are stable. Although the fishing has been above the precautionary level in recent years, one or two better year-classes have also increased the SSB above the precautionary level, so although ICES advice is to reduce fishing rate to the precautionary level, the 2006 TAC for ICES Subarea VII and Divisions VIIIa,b,d,e is 20,425 tonnes, compared with 21,500 tonnes in 2005, and 20,200 tonnes in 2004. The area VII share of the 2006 TAC is 18,300 tonnes.

### 5.3.6 Northern hake

Northern *hake* is widely distributed along the western seaboard, but is assessed as a single stock. During the 1980s and early 1990s landings, recruitment and SSB all declined as the assessed fishing rate increased to high levels in the 1990s. Although the fishing rate on hake is lower than that on the cod and haddock stocks, it has in the past included a component on young hake that has contributed to the poor stock status. In 2000, ICES called for a recovery plan, and over the last few years the EU has restricted the TACs, increased the main hake mesh size to 100mm, and restricted fishing in nursery areas south of Ireland and in the Bay of Biscay. More recently, the European Commission has enacted a Council Regulation (EC) No 811/2004 that establishes measures for the recovery of the northern hake stock. The 2005 assessment indicates that the fishing rate is only marginally below the precautionary level, and that SSB is just below the precautionary limit. The TACs agreed for 2006 were 24,617 tonnes for ICES Division Vb (EC waters) and Subareas VI, VII, XII and XIV, and 16,419 tonnes for ICES Divisions VIIIa,b,d,e, compared with 23,888 tonnes and 15,932 tonnes, respectively, in 2005 and 21,926 tonnes and 14,623 tonnes, respectively, in 2004.

### 5.3.7 Northeast Atlantic mackerel

*Mackerel* is assessed as the single Northeast Atlantic (NEA) stock which combines the Southern, Western and North Sea spawning components. SSB has been remarkably stable over the last two decades, with a slight

decline since 2001. The stock is classified as being harvested unsustainably and preliminary information on the 2003 year-class suggests that it is low. The advice is to reduce the fishing rate on NEA mackerel to the precautionary level, whilst maintaining measures to protect the North Sea spawning component. The TAC agreed for 2006 is 415,824 tonnes compared with 420,000 tonnes in 2005 and 545,500 tonnes in 2004.

#### 5.3.8 Western cod

The fishing rate on the stock of *cod* occupying the western Channel, Celtic Sea and Western Approaches may have fallen in recent years from historical levels similar to those found in the North Sea but the precise level is uncertain due to recent changes in discarding practices. Historically, recruitment has been highly variable, but indications from survey data suggest that recent recruitments have been low. The TAC for 2006 is 5,580 tonnes compared with 6,200 tonnes in 2005 and 5,700 tonnes in 2004.

#### 5.3.9 Irish Sea roundfish

The *cod and whiting* stocks in the Irish Sea are seriously depleted, and landings fell rapidly during the 1980s and 1990s. The fishing rate has been very high, spawning stocks have fallen below both the precautionary and the lower limit level, and the abundance of young cod and whiting has been in decline since 1990. After 2000, the EU significantly reduced the *cod* and *whiting* TACs, closed the cod spawning area in the western Irish Sea during the spawning season, and increased the main whitefish mesh size to 100 mm. The 2005 *cod* assessment, which is rather uncertain, suggests that the fishing rate has declined but the stock is still over-fished. The European Commission has enacted a Council Regulation (EC) No 423/2004 that establishes measures for the recovery of cod stocks. The cod TAC agreed for 2006 is 1,828 tonnes (compared with 2,150 tonnes in 2005 and 2004). There is no *whiting* assessment in 2005 but long-term information on the historical yield and catch composition indicate that the present stock size is low. ICES continues to advise a recovery plan with a zero catch option. The TAC for 2006 is 437 tonnes (compared with 514 tonnes in 2005 and 2004). In the relatively new fishery for *haddock*, landings have declined since the peak of 1998 although total landings in 2004 are uncertain. No reliable assessment is available for the stock but the fishing rate remains at a high level relative to taking high long-term yields. The TAC agreed for 2006 is 1,275 tonnes (compared with 1,500 tonnes in 2005 and 2004).

#### 5.3.10 Irish Sea flatfish

The fishing rate on Irish Sea *plaice* has declined significantly over the last decade and is now below the precautionary level, with SSB above  $B_{pa}$  after a period of low SSB associated with low recruitment through the 1990's. The plaice TAC agreed for 2006 is 1,608 tonnes, which is the same as in 2005, but with an additional 15% that may be fished between 1<sup>st</sup> June and 30<sup>th</sup> September 2006. The Irish Sea *sole* fishing rate is uncertain but commercial CPUE indicates a stable stock situation in recent years which is confirmed by survey information. The sole TAC agreed for 2006 is 960 tonnes, which is the same as in 2005.

### 5.3.11 West of Scotland roundfish

The *cod and haddock* stocks west of Scotland are heavily overfished. The state of *whiting* is uncertain, but all indicators suggest that the stock is low. Survey SSB estimates indicate that cod and whiting stocks have been declining in recent years. ICES called for a recovery plan in 2000, with low or zero catches, and the EU has since cut the *cod* and *whiting* TACs significantly, implemented two small closed areas, and in 2003 increased the main whitefish mesh size to 120 mm in line with the North Sea. More recently, the European Commission has enacted a Council Regulation (EC) No 423/2004 that establishes measures for the recovery of cod stocks. The TAC for 2006 is 613 tonnes for cod (compared with 721 tonnes in 2005 and 848 tonnes in 2004), and 1,360 tonnes for whiting - a reduction from 1,600 tonnes in both 2005 and 2004. Based on the most recent estimate of SSB and fishing rate *haddock* is harvested sustainably. The very strong 1999 year-class has caused SSB to increase from its historic low in 2000 to above precautionary levels since 2001. The TAC for 2006 is 7,810 tonnes (compared with 7,600 tonnes in 2005 and 6,503 tonnes in 2004).

## 6 Overview of the fishing industry in Europe

### 6.1 The European fishing fleet

Table 6.1 shows the composition of the European Union fishing fleet as at 31 December 2005.

There were almost 84,000 vessels in the original 15 member states of the EU at the end of 2005. The total size of the EU fleet, allowing for the ten new member states joining on 1 May 2004, is around 89,000. Greece, Spain and Italy have 52 per cent of the total EU fleet and the UK has 8 per cent. Under 12 metre vessels account for 94 per cent of the Greek fleet and Spain and Italy account for 50 per cent of all vessels in the EU of 12 metres or over.

**Chart 6.1 European fleet by nationality of vessel: 31 December 2005**

### 6.2 EU fleet, quotas and uptake

Table 6.2 shows the 2005 European Union Total Allowable Catch (TAC) and quota (after exchanges etc) for each stock, together with landings by each member state. These are derived from reports to the European Commission by each member state detailing landings into their own country by their own vessels and those of other member states. The figures may therefore differ from those for the UK reported in Chapter 3, which are based solely on the UK's record of landings into the UK and abroad.

(a) UK figures are as reported to the European Commission in 2005. These data, however, are still provisional and do not take into account flexibility arrangements, or small adjustments required to UK landings abroad by other member states.

# 7 Overview of the world fishing industry

## 7.1 World catch

The world catch data (Tables 7.1 and 7.2) presented in this chapter have been extracted from the most recently available data from the Food and Agricultural Organisation of the United Nations (FAO). These tables present the annual statistics, for six years ending in 2004, on a world-wide basis, of nominal catches (See Appendix 1, Glossary of terms).

The world catch figures from marine fishing areas rose by 5 per cent from 81.5 million tonnes in 2003 to 85.8 million tonnes in 2004.

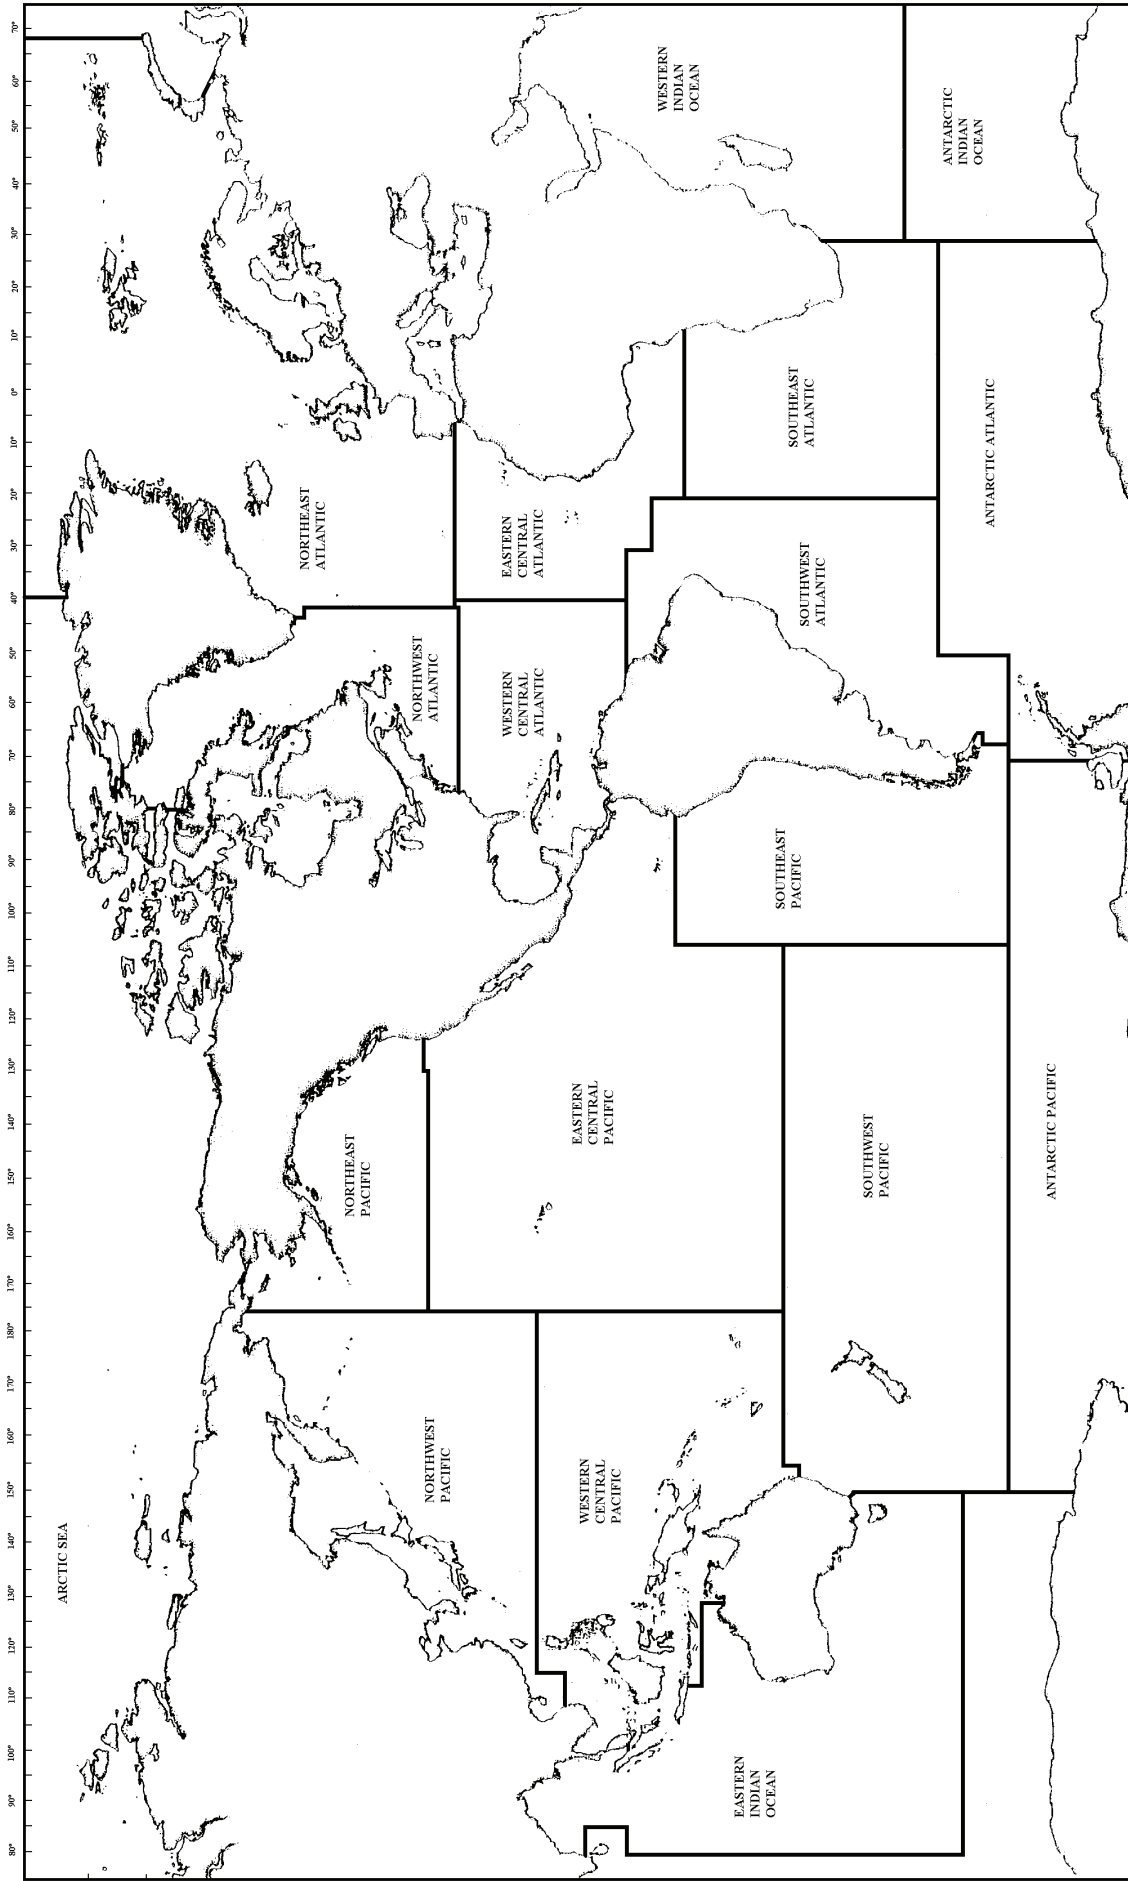

In 2004 China caught the largest volume of fish, 14.6 million tonnes. Peru had the second largest annual catch at 9.6 million tonnes. The USA, Japan, Indonesia and Chile each caught between 4 and 5 million tonnes.

Of the 85.8 million tonnes of fish caught in 2004, 62 per cent were caught in the Pacific Ocean, 26 per cent were caught in the Atlantic and 11 per cent in the Indian Ocean.

Marine catches from the Pacific Ocean have shown a long-term gradual increase reaching a maximum of 53.6 million tonnes in 2000. Landings then fell but rose to 53.5 million tonnes in 2004, an increase of 10 per cent on 2003.

In the Atlantic the 2004 catch is 9 per cent lower than in 2001. Overall, in the Atlantic Ocean, marine catches have tended to fluctuate between a low of 22.7 million tonnes (1991) and a high of 26 million tonnes (1976). In the Indian Ocean, marine catches have been gradually increasing, from 6.8 million tonnes in 1991 to 9.8 million tonnes in 2004.

**Chart 7.1 Major FAO fishing areas**

**TABLE 7.1 World catch by nationality of vessel: 1999 to 2004**

Figures refer to Marine Fishing Areas unless otherwise specified

# Appendix 1: Glossary of terms

<b>Demersal</b>	The term demersal fish covers species living on or near the sea bed.
<b>Exports</b>	Exports consist of the outward movement of goods produced by businesses in the UK, plus goods, which after importation, move outward from bonded warehouses or free zones without having been transformed i.e. both exports and re-exports. Export statistics exclude fish caught by domestic fishing craft, whether or not processed on board, landed in foreign ports.
<b>Fishing areas</b>	Fishing areas are defined by international convention. The immediate waters around the UK are subdivided into ICES Sub-areas IV (North Sea), VI (West of Scotland) and VII, and its divisions (Western Approaches, VIIg,h; the Irish Sea, VIIa; and the Channel, VIId,e).
<b>Fishing capacity</b>	Fishing capacity is the physical dimension of fishing vessels measured in tonnage, kW or VCU.
<b>Fishing effort</b>	Fishing effort is a measure of the fishing activity of vessels based on fishing capacity and the time spent fishing. It may be expressed in tonnage days, kW days etc.
<b>Fishing mortality</b>	Fishing mortality is the proportion off a stock killed/dying each year as a result of fishing activity.
<b>Fixed gears</b>	Fixed gears are mainly used for demersal species. They are normally vertically hung curtains of netting which enmesh or entangle the fish, fixed to the seabed with anchors or weights and held upright with floats.
<b>GRT</b>	GRT (Gross Registered Tonnage) is a general term applied to a range of volumetric measures of vessel capacity.
<b>GT</b>	GT (Gross Tonnage) is a volumetric measurement of vessel capacity under the rules of the ITC69 (International Tonnage Convention). By the end of 2003 all UK fishing vessels over 15m overall length must have their tonnage measured on this basis.
<b>GT*</b>	GT* is an estimate of fleet tonnage for vessels as it would be measured under the rules of ITC69. A set formula derives the estimate from the physical characteristics of the vessel. The estimate is used in place of an actual measured gross tonnage for all vessels under 15m overall length and for those vessels over 15m that have yet to be remeasured.
<b>Imports</b>	Imports consist of all goods moving into a country, including goods for domestic consumption and goods into bonded warehouses or free zones. In accordance with the internationally recommended practice, import statistics include fish caught by foreign fishing craft, whether or not processed on board, landed in domestic ports.

<b>Nominal catches</b>	Nominal Catches consist of fish, crustaceans, molluscs and other aquatic animals, taken for all purposes (commercial, industrial and subsistence) except recreational, operating in inshore, offshore and high seas fishing areas (marine fishing areas). Inland waters, both fresh and brackish, are excluded. In view of the difficulty of distinguishing in many cases between recreational and subsistence fishing, figures may include recreational catches. Nominal catches refer to the landings converted to a live weight basis. There are many instances where the catches on board fishing vessels or factory ships are gutted, filleted, salted, dried, etc., or reduced to meals, oil, etc. The data on the landings of such species and products require conversion by accurate yield rates (conversion factors) to establish the live weight equivalents at their time of capture.
<b>Pelagic</b>	The term pelagic fish covers species found mainly in shoals in midwater or near the surface of the sea.
<b>Purse seining</b>	Purse seining is a method used exclusively for pelagic operations. A very large, deep net is shot around a fish shoal and is then closed, or pursed, at the bottom to trap the fish. The net is then hauled upwards to concentrate the fish near the surface, and the fish are taken on board using a separate lifting net or pump.
<b>Recruits</b>	Recruits are the young fish in the year class which is entering the fishery.
<b>Seining</b>	Seining is a method used exclusively for demersal fishing. The net, lighter than for trawling, is set on very long ropes designed to herd or contain the fish for capture in the net. After the fish have been surrounded by the ropes, the net is slowly hauled back to the vessel.
<b>Shellfish</b>	The term shellfish covers all crustaceans and molluscs.
<b>Spawning stock biomass (SSB)</b>	The spawning stock biomass (SSB) is the total weight of a species population capable of reproducing.
<b>Stock</b>	A stock is that part of a species population exploited in a defined fishing area.
<b>Trawling</b>	Trawling may be used either for bottom-dwelling (demersal) or mid-water (pelagic) species, the net being of a basic funnel-shaped construction and towed behind a vessel or between two vessels (pair trawling).
<b>VCU</b>	VCU (Vessels Capacity Unit) is calculated as follows: the overall length of the vessel in metres is multiplied by the breadth of the vessel in metres. This figure is then added to the power of the engine in kilowatts multiplied by 0.45.
<b>Year class</b>	A year class is the young of any one annual spawning.

## Appendix 2: UK fisheries statistics methodology

### Organisation of the national system of fisheries statistics

Fisheries data are mostly collected by officers in the Sea Fisheries Inspectorates and processed by officials of the various Fisheries Administrations in the UK, namely the Marine Fisheries Agency (MFA) (for England and Wales), the Scottish Executive Environment and Rural Affairs Department (SEERAD) and the Department of Agriculture and Rural Affairs for Northern Ireland (DARD) and Departments in Jersey, Guernsey and the Isle of Man.

The main legislation used is:

- (i) the EU fisheries legislation on keeping and submitting logbooks and providing landing declarations - Council Regulation (EEC) No. 2847/93 (as amended) and Commission Regulation (EC) No 2807/83 (as amended) .
- (ii) general powers under the Sea Fisheries (Conservation) Act 1967 under which Ministers granting a licence can require the master, owner or charterer of the vessel named in the licence to provide him with such statistical information as he may direct. These powers were widened in the Sea Fish (Conservation) Act 1992 to cover other types of information and the form in which it is to be supplied.

The MFA collates the information compiled by Fisheries Administrations in the UK for this publication.

### Method of collecting, processing and compiling the data on catches, landings and average prices

**Sources of data** - The sources include logbooks, landing declarations, sales notes and personal contact with fishermen and merchants. Port harbour masters also provide details of individual vessels landing at main coastal locations. The method used for collecting data depends upon the size of vessel and location of landings. Legislation covers the supply of data on log sheets for all vessels over 10m overall length in respect of catches of all species. Much information on the value of catches is provided by the industry. For vessels under 10 metres overall length, there is no statutory requirement under either EU or national legislation for fishermen to declare their catches. Information for this sector has been collected with the co-operation of the industry: it comprises log sheets and landing declarations voluntarily supplied by fishermen and assessments of landings derived from market sources and by correspondents located in the ports.

Full documentation is not required for most fishing for non-TAC species, including shellfish, and summary records are compiled using information supplied voluntarily by the industry, from a variety of local sources and surveys run by local Sea Fisheries Committees.

**Landings abroad** - UK vessels which land at foreign ports are required under EU legislation to dispatch copies of log sheets and landing declarations covering their trips to the vessels' home ports within 48 hours of landing. When these data are received at the home port, they are entered on the systems used for UK landings.

**Attribution of area of capture** - Details of the areas fished are taken from the logbooks and codes for the ICES divisions and statistical rectangles are keyed into the port micro-computers. Where a statistical rectangle is split into different areas (e.g. part is in EU waters and part in the Norwegian waters) an additional code is used to indicate the zone fished. The detailed codes are available on the central computer records. Where a vessel fishes in more than one area in a single trip, the total amounts for the trip of each species, as given in the sales notes and landing declarations are allocated to the areas in proportion to the estimated quantities of the species taken from each area, as recorded in the logbook. For the few landings from distant waters, the coding of the areas is less detailed but sufficient to identify the quota concerned.

**Value of landings and average price data** - Sales note information has been routinely provided for landings into Scotland. For landings into England, Wales and Northern Ireland much information is supplied by fishermen, though the amount of detail provided on grade and freshness is less complete. Average prices are derived using the presentation codes of the landings and the average values and quantities landed.

**Data capture and processing** - The inspectors at port offices carry out manual checks on the information provided. These include a check between logbook information and that given in the sales notes or observed as landed. Information from log sheets, landing declarations and other sources are then keyed into micro-computers connected to the main databases by government staff at port offices. In England and Wales new data entry facilities were introduced in late 1993 enabling details from the daily log sheet to be keyed though catch records may be summarised where these cover fishing over several days with the same gear and in the same rectangle. The catch data are used to apportion information from the landing declaration/sales note which is keyed separately. The fishing records are transmitted to the central computer systems where further checks are carried out on the data before they are reflected on the main landings databases.

Catch and landings statistics for the UK are compiled from the systems run by the MFA and SEERAD. The former holds information on all landings into England, Wales and Northern Ireland by UK vessels and of landings abroad by vessels administered by the MFA and DARD while the latter provides figures for landings into Scotland by all UK vessels and landings abroad by SEERAD administered vessels.

**The reliability and completeness of the data**

**Completeness** - The collection system for all vessels over 10m attempts a complete coverage of all main fishing activity. Assessments based on local knowledge are used to estimate uptake of some fishing activity by vessels under 10 metres and for some shellfishing: proposals to move to a structured sampling system to estimate landings by the under 10 metre fleet are being considered.

**Reliability** - The reliability of the statistics is dependant upon the veracity of the documentation provided by fishermen. There are systems of surveillance using sightings by aircraft and by fisheries protection vessels and by satellite monitoring. This information is employed in checking the data.

## Appendix 3: Further information

Other useful official publications on sea fisheries statistics are:-
