10a Animals (toxicology) by species of animal and toxicological purpose	33
11 Scientific procedures (toxicology) by species of animal, type of legislation and toxicological purpose	34
12 - 16 Scientific procedures (toxicology) by species of animal and type of toxicological test:	
12 - all purposes	36
13 - safety testing of non-pharmaceuticals other than cosmetics	37
15 - pharmaceutical safety	38
16 - other safety/toxicology	39
17 Project licence holders and scientific procedures by type of designated establishment	40
18 Designated establishments: 2003 – 2011	40
19 Personal licensees: 2003 – 2011	40
Appendix	
General System of Control	41

Introductory Notes

1. The statistics in this publication relate to experiments or other scientific procedures on living animals which were subject to the provisions of the Animals (Scientific Procedures) Act 1986 during the year from 1 January 2011. The system of control under the 1986 Act is explained in detail in the Appendix. Under this Act any scientific procedure carried out on any living vertebrate animal, or one species of octopus (*Octopus vulgaris*), which may cause that animal pain, suffering, distress or lasting harm is a regulated procedure requiring licence authority. Recognised veterinary, agricultural or animal husbandry practice and the administration of medicines under an Animal Test Certificate granted under the Medicines Act 1968 are excluded from the controls of the Act. Statistics of scientific procedures on living animals are collected and published annually. They are structured to comply with European Union requirements, but the data provided are far more extensive than required by Europe.

Collection procedures

2. The statistics are compiled from, and largely based on, a detailed form returned by project licence holders at the end of each year, or on termination of the licence where this occurred during the year. This return, completed by each project licence holder, provides details of the species of animal used, the main purpose of the procedure and other details as described in paragraphs 7-12 below. In these statistics each procedure (which may consist of several stages) for a given purpose on an animal is counted as one returnable procedure in the year in which it commenced. A study involving a procedure using a number of animals is counted once for each animal. Where an animal which has recovered fully from a returnable procedure is used again for a further procedure, this is counted as a separate procedure, but the animal itself is not re-counted. The circumstances in which re-use of an animal is permitted are limited.
3. To complete the return, project licence holders were asked to classify their procedures. The current classification system dates from 1995 and is considerably more detailed than that used previously; further slight modifications were introduced for the 1999 statistics in the areas relating to source of animals, production and breeding, toxicology and legislation.
4. Details of the work of individual project licence holders are not identifiable in this publication.

Description of statistical tables

5. Project licence holders were asked to answer 15 questions about the procedures performed, 12 of which identified individual characteristics explained more fully in paragraphs 7-13 below.
6. Table 17 covers information on project licence holders, their place of employment and numbers of procedures.

Procedures in 2011

Species of animal

7. All the tables except 1a, 5a and 10a give the number of procedures. Tables 1a, 5a and 10a give the actual number of animals used for the first, and usually only time, and are classified according to their first use.

The list of species or categories of animals is selective to avoid undue complications; where collective terms are used it is because previous experience suggests that the category will contain a relatively small number or because further breakdown is of little interest. In several of the tables, rows which are completely zero have been omitted and if a species is not mentioned it is because the row or rows pertaining to that species is completely blank.

Genetic status of animal

8. Tables 2 (source), 3 (genetic status), and 5 (non-toxicological work by field of research) are subdivided to give more information about animals with abnormal genetic constitutions. Table 2 shows procedures using all animals, as in publications for years before 1998.

Primary purpose (Table 1)

9. Use of animals for regulated procedures is limited by Section 5(3) of the Act to one of the following primary purposes:
- (i) **fundamental biological research;** carried out with the primary intention of increasing knowledge of the structure, function and malfunction of the body (in both animals and man). Such studies may be aimed solely at an increase in knowledge, application of that knowledge being beyond the scope of the investigation, or with a view to providing a practical solution to a medical or veterinary problem once the issues are more clearly defined and understood. This category includes physiological, pathological, pharmacological, genetic and biochemical studies, including toxicological evaluation.
 - (ii) **applied studies - human medicine or dentistry, and veterinary medicine;** consisting of research into, development of and quality control of products or devices, including toxicological evaluation and safety or efficacy testing.
 - (iii) **protection of man, animals or the environment;** by toxicological or other safety or environmental evaluation. This category is intended to cater for toxicological work which is not related either to fundamental research or to the solution of medical and veterinary problems as such (see (i) and (ii) above), but also includes some non-toxicological procedures. This category is further divided into a number of subgroups (listed in Tables 10 and 10a). These are largely self-explanatory but the following notes may be helpful in understanding the figures:
 - (a) while any one substance may be used in industry or in the home, or may be an environmental pollutant, a herbicide or a pesticide, the project licence holder classifies the procedure in accordance with the particular context of the procedure and the expected primary use of the product;
 - (b) animal pesticides (as distinct from plant pesticides) are not included amongst the types of substances listed, because a substance intended to kill pests which infest or attack animals would be regarded as a veterinary product. These are included in the appropriate body-system group covered by primary purposes described in (ii) above;
 - (c) many of the procedures recorded under this category are required by UK law or by the laws and regulations of countries in which it is intended to use the substance concerned;

- (d) the term 'food additives' covers substances deliberately added to food as preservatives, artificial colourants or flavouring agents but not studies on the nutritive value of food, accidental contamination or infection of food, or medicines administered to animals or humans in food.
- (iv) **education and training;** these categories include procedures carried out under project licences for the purposes of education or training under the 1986 Act. They also include killing of animals by methods not included in Schedule 1 to the 1986 Act, if the killing takes place for educational purposes at a designated establishment. Such killing may be authorised to provide, for example, tissues subsequently used for education or training. The use of animals for the acquisition of manual skills is permitted only for training in microvascular surgery.
- (v) **forensic enquiries;** may refer to animal use in human or veterinary enquiries relevant to potential legal proceedings.
- (vi) **direct diagnosis;** investigation of disease including investigating suspected poisoning. This caters for procedures carried out under the 1986 Act for the purpose of diagnosing disease in an individual human or animal patient or a group of such patients. There is no research function: these are essentially applied studies, predominantly involving antibody and other tissue production.
- (vii) **breeding;** a category for recording the production and breeding of animals with harmful genetic defects and genetically modified animals. The numbers recorded in this category include those animals which are identified as possessing a harmful mutation or are genetically modified, but not used subsequently on procedures which are recorded elsewhere in the tables. The numbers also include some genetically normal animals which were subjected to regulated procedures such as tissue sampling or hormonal administration for the purpose of regulated breeding programmes (see Table 3).

Source of animals (Table 2)

10. Sections 7 and 10(3) of the Act require, unless a specific exemption is granted, that certain animals, listed in Schedule 2 to the Act, be obtained from designated breeding or supplying establishments certified as such by the Department. The species so listed are: mouse, rat, guinea-pig, hamster, gerbil, ferret, rabbit, cat, dog, primate, quail (*Coturnix coturnix*) and pigs and sheep if genetically modified. The source of these species is tabulated according to whether it is within the UK, within the remainder of the EU, within certain Council of Europe (but non-EU) countries who are signatories to convention ETS 123, or elsewhere. Animals which originate from non-designated sources, such as overseas breeding centres, but which are acquired by the project licence holder from a designated supplying establishment in the UK, are reported under the heading "Animals acquired from other designated breeding or supplying establishments in the UK." In columns 4, 5 and 6 of the table, supplies of Schedule 2 listed species from non-designated sources in the UK, or from Europe or elsewhere, were subject to prior approval by the Department. Such supply was justified on the basis of scientific need or unavailability of appropriate animals from designated breeding or supplying establishments.

Stage of development and genetic status, and breeding (Table 3)

11. **Stage of development**

Details of procedures on immature forms were collected but not enumerated because it is impracticable in some cases to count such procedures, e.g. a foetus resorbed during gestation, or fish fry which are very small and fast-moving.

Genetic status

Only the number of animals in which the harmful genetic defect actually manifested itself has been recorded. All genetically modified animals are recorded.

Target body system (Table 4)

12. Some of the headings in the tables are self-explanatory but, for the others, further explanation is given below.

Abbreviated title	Description: studies in which interest centres on:
Nervous	The central or peripheral nervous systems, other than the special senses
Senses	Sight, hearing, smell, or taste
Alimentary	The alimentary (including liver) and excretory systems
Musculo-skeletal	The skeletal or muscle system
Immune and reticulo-endothelial	The understanding and operation of the immune system
Other system	A single body system not separately listed in the table
Multiple systems	More than one system of primary interest
System not relevant	The system or systems affected were not predictable or not relevant

Type of procedure

13. This is divided into two groups:
- (a) fundamental and applied studies other than toxicology (Tables 5-9);
 - (b) toxicity tests, or other safety or efficacy evaluation (Tables 10-16).

Licensees reporting procedures were asked to classify them depending on whether the procedure fell within (a) or (b) above.

If the purpose of the procedure was toxicological, the licensee was asked to report on the field of safety testing or efficacy evaluation, the type of test or procedure, and the legislative requirements (if any) under which the procedure was performed.

If the purpose was non-toxicological, the licensee was asked to specify the field of research, the nature of the procedure with regard to production and breeding and whether the technique was identified as being of particular interest.

The two strands of reporting are mutually exclusive and it is not possible, for instance, to identify procedures using a technique of particular interest if the purpose of the procedure was toxicological.

(a) **Fundamental and applied studies other than toxicology**

This group is sub-divided into four main areas of interest:

(i) **Field of research** (Tables 5 and 5a)

These headings are self-explanatory, but the following should be noted:

- (a) pharmaceutical research and development excludes anti-cancer agents, where work is listed separately later in the table under 'cancer research';
- (b) ecology excludes work done in toxicology and other safety evaluation;
- (c) tobacco and alcohol research lists only those procedures done for research on the effects of tobacco or alcohol and not those where these substances are used as experimental tools or standards; note also that tobacco *safety* procedures would be reported in table 10.

(ii) **Use of anaesthesia** (Table 4b)

This also indicates whether or not a neuromuscular blocking agent (NMBA) was used. The codes for anaesthesia distinguish procedures involving one or more stages, in which there was anaesthesia with recovery, from procedures in which the only anaesthesia was terminal. They also include the use of local or regional anaesthesia. The categories are:

- (a) no anaesthesia used throughout the procedure; this will include procedures without anaesthesia even where the subject animal may have been killed by use of an anaesthetic overdose at the end of the procedure. It also includes studies of potential anaesthetic agents;
- (b) general anaesthesia with recovery;
- (c) local or regional anaesthesia;
- (d) general anaesthesia without recovery, at the end of the procedure only;
- (e) general anaesthesia without recovery, throughout the procedure.

The killing of an animal by the administration of an overdose of an anaesthetic agent (a recognised humane way of disposal as cited in Schedule 1 to the Act) is not a regulated procedure and should not be recorded *as such* in the above table.

(iii) **Production of biological materials** (Table 8)

Production:

- Procedures for production and maintenance of infectious agents (excluding neoplasms);
- procedures for production and maintenance of vectors; e.g. parasites;
- procedures for production and maintenance of neoplasms;
- the ascites model for the production of monoclonal antibodies;
- initial immunisation for subsequent *in vitro* or *in vivo* production of monoclonal antibodies;
- procedures for production of polyclonal antibodies;
- procedures for production of other biological material, eg plasma, tissues.

Breeding:

Breeding of animals with harmful genetic defects or genetically modified animals is a regulated procedure under a project licence. Recorded in this category are those animals which are identified as 'harmful' or 'genetically modified' but not used subsequently in procedures which are recorded elsewhere in the tables. The numbers also include some genetically normal animals which were subjected to regulated procedures such as tissue sampling or hormonal administration for the purpose of regulated breeding programmes. Furthermore, this category also includes some animals possessing harmful but naturally occurring genetic mutations, and some genetically modified animals, which have been used for purposes other than breeding but for which this category is most appropriate from the list on choices of the returns form.

The figures for breeding in table 8 do not match those reported in table 3: (see paragraph 10 above) incorporates all procedures and looks at the purpose of the procedure as coded in the return form, whilst table 8 includes only procedures for fundamental and applied studies *other than* toxicology, regulatory or safety evaluation, and the columns of that table reflect coding of the return form, for production and breeding.

(iv) **Techniques of particular interest** (Table 9)

This table provides a selective list which identifies those procedures in which a technique is of itself of particular interest as, for example, the application of a substance to the eye or exposure to ionising radiation. The procedures recorded in this table do not include those undertaken for toxicology or safety evaluation.

(b) **toxicity tests, or other safety or efficacy evaluation**

(i) **Safety and efficacy evaluation** (Tables 10, 10a)

Most of the subdivisions have been described in paragraph 10(iii) above with regard to general safety or efficacy evaluation but the category also includes work done for pharmaceutical safety and efficacy evaluation, and some other purposes as follows:

- efficacy evaluation (acute, subacute and chronic);
- absorption, distribution, metabolism, excretion and residue tests;
- nutritional evaluation;
- quality control;
- toxicology research;
- tobacco safety (note: tobacco *research* is recorded in table 5 - see above);
- medical device safety;
- method development, and other tests.

(ii) **Legislative requirements** (Table 11)

This identifies medical/dental and veterinary categories which include procedures used in the initial development and selection of such products, those required to satisfy specific legislation (medical and non-medical) such as the Medicines Act 1968 and/or equivalent overseas or international legislation or regulations for purposes such as the intention of registration or the intention of presenting batch quality control data; and those carried out for other reasons. The legislation is divided into seven groups:

- (a) United Kingdom legislation only;
- (b) legislation specific to one EU country only (excluding the UK);
- (c) general EU requirements, including the European Pharmacopoeia;
- (d) non-EU member country of Council of Europe legislation;
- (e) legislation of other countries;
- (f) any combination of (a)-(e);
- (g) purposes other than legislative requirements.

The following are examples of specific legislative requirements which may be included:

- Medicines Act 1968;
- Workplace safety - eg Health and Safety at Work (Northern Ireland) Order 1978, COSHH Regulations;
- Substances used in agriculture - eg Control of Pesticides Regulations (Northern Ireland) 1987; EU Pesticides Directives;
- Substances used in foodstuffs - eg The Food Safety (Northern Ireland) Order 1991.

(iii) **Specific types of toxicity tests** (Table 12)

- acute and subacute dose ranging or limit setting lethal toxicity tests;
- acute quantitative lethal toxicity tests;
- acute and subacute non-lethal clinical sign toxicity tests;
- subchronic and chronic toxicity tests;
- carcinogen/teratogen/mutagen tests;
- other reproductive toxicity tests;
- tests for clinical signs in the eye;
- tests for clinical signs on the skin, including irritation or sensitisation;
- toxicokinetics, pyrogenicity, biocompatibility and other toxicology tests.

(iv) **Tables showing some selected work in greater detail**

There are three further tables (13, 15 and 16), which examine safety testing of toxicological work in greater detail.

- table 13: substances other than pharmaceuticals
- table 15: pharmaceuticals
- table 16: other safety or toxicology

Project Licence Holders and Designated Places

Type of designated place (Table 17)

14. Project licence holders have been classified according to the type of designated place which was their main place of employment at the end of the year, although they could be licensed to carry out procedures at more than one place. Procedures have been classified according to the type of designated place of the project licence holder reporting them.

Commentary

15. The main features of the statistics for 2011 were:

The number of scientific procedures started was 18,538 an increase of 227 on the previous year. (Tables 1, 2, 3 and 4).

- (b) The number of animals used for the first time was 17,687. This is in comparison to 17,668 used in 2010 (Table 1a).
- (c) The species of animals involved in the largest number of procedures in 2011 was mouse (64%), sheep (12%), domestic fowl (9%) and cattle (6%). Between 2010 and 2011 there was an increase in the number of procedures on sheep (1,378) and a decrease in mouse (1,280). There were no procedures carried out on primates (Tables 1 and 3).
- (d) Some 12,776 procedures started used animals acquired from designated establishments within the United Kingdom. There were no procedures started using animals acquired from non-designated sources in the United Kingdom, 7 procedures using animals acquired from sources within the EU (outside the UK), 3 procedures using animals from other sources, and 5,752 procedures used animals not listed in Schedule 2 to the Act (Table 2).
- (e) 2% (362) of procedures started involved animals with a harmful genetic defect, (13 more than in 2010). There were 6,952 animals involved in genetically manipulated procedures. The majority of procedures started in 2011 (61%) involved normal animals (Table 3).
- (f) 3,474 procedures (19% of the total) were aimed at more than one body system, 272 (1%) concerned the reproductive system, and 1,596 (9%) concerned the alimentary system. There were 1,631 procedures (9%) concerning the cardiovascular system and 1,510 (8%) concerned the nervous system. Some 2,655 procedures (14%) were those in which the body system or systems affected were either not predictable or not relevant (Table 4a).
- (g) Most procedures (71%) were so minor that the use of anaesthesia was not appropriate. The remaining 29% either used anaesthesia with recovery or were procedures in which the anaesthesia was terminal. The corresponding figures for 2010 were 72% and 28% respectively. (Table 4b).
- (h) Among non-toxicological work, certain procedures have been identified as being of particular interest. Some 1,524 (9%) of the procedures started in 2011 used a technique identified on the code list to record these procedures. (Table 9).
- (i) Of the 18,538 procedures started 10% concerned toxicology studies (Tables 10 - 16). The number of animals used in such work was 1,812 with mouse (50%) being the largest numbers used (Table 10).
- (j) The 1,812 procedures (1,144 less than in 2010) involving toxicology were performed in order to comply with the provisions of one of the following Acts, Orders or equivalent overseas legislation: Medicines Act 1968, Health and Safety at Work (Northern Ireland) Order 1978, Agriculture (Poisonous Substances) Act (Northern Ireland) 1954, The Food Safety (Northern Ireland) Order 1991 or other legislation or regulations. Of these procedures 476 (26%) were used in safety testing products (Table 11).

- (k) 60% of the projects on which procedures were started were based at universities (including medical schools) and they accounted for 63% of the procedures. Projects at non-profit making organisations accounted for 33% of the projects started, and 30% of procedures. Commercial concerns projects accounted for 7% of projects started and 7% of procedures. (Table 17).
- (l) Returns were received in respect of 127 project licences in 2011, 4 more than in 2010. Some project licence holders would have made two returns for 2010, one relating to the expiring licence and one to the successor licence. A total of 75 licences carried out procedures in 2010. (Table 17).
- (m) The number of personal licensees authorised to carry out regulated procedures under the Act was 582 (Table 19).

Appendix

General system of control under the Animals (Scientific Procedures) Act 1986

Introduction

1. The Animals (Scientific Procedures) Act 1986 put in place a rigorous system of controls on scientific work on living animals, including the need for both the researcher and the project to be separately licensed; stringent safeguards on animal pain and suffering; and general requirements to ensure the care and welfare of animals.

Scope of the Act

2. The Act controls any experimental or other scientific procedure applied to a 'protected animal' which may have the effect of causing that animal pain, suffering, distress or lasting harm. Such work is referred to in the Act as a 'regulated procedure'. 'Protected animals' are defined as all living vertebrate animals, except man, plus one invertebrate species, *Octopus vulgaris*. The definition extends to foetal, larval or embryonic forms which have reached specified stages in their development. Under the Act an animal is regarded as 'living' until "the permanent cessation of circulation or complete destruction of its brain". Procedures carried out on decerebrate animals are also subject to the controls of the Act.
3. The definition of a regulated procedure encompasses some breeding of animals with genetic defects; production of antisera and other blood products; the maintenance and passage of tumours and parasites; and the administration for a scientific purpose of an anaesthetic, analgesic, tranquilliser or other drug to dull perception. Killing an animal requires licence authority in certain circumstances.
4. The controls of the 1986 Act do not extend to procedures applied to animals in the course of recognised veterinary, agricultural or animal husbandry practice; procedures for identification of animals for scientific purposes, if this causes no more than momentary pain or distress and no lasting harm; or clinical tests on animals for evaluating a veterinary product under authority of an Animal Test Certificate (issued under the Medicines Act 1968).

Project and Personal Licences

5. Two kinds of licence are required for all scientific work controlled by the Act. The procedures must be part of a programme of work authorised by a project licence and the person applying the regulated procedures must hold a personal licence. No work may be done unless the procedure, the animals used and the place where the work is to be done are specifically authorised in both project and personal licences.
6. A project licence is granted when the Department of Health, Social Services and Public Safety (hereinafter referred to as the Department) considers that the use of living animals in a programme of work, for a purpose permitted by the Act, is justified and the methods proposed appropriate. In deciding whether and on what terms to authorise the project, the likely adverse effects on the animals used must be weighed against the benefit (to humans, other animals or the environment) which is likely to accrue from the work.

Adequate consideration must also have been given to the feasibility of using alternative methods not involving living animals. The holder of a project licence undertakes overall responsibility for the scientific direction and control of the work and is responsible for making the statistical returns on which this publication is based. New project licence applicants are now required to complete an accredited training course before the licence is granted.

7. A personal licence is the Department's endorsement that the holder is a suitable and competent person to carry out specified procedures on specified animals, under supervision where necessary. Applicants must be over 18 and are required to give details of their qualifications, training and experience. Those who have not previously held a licence need the endorsement of a sponsor (normally someone in a senior position at the applicant's place of work). Satisfactory completion of an accredited training course is also required before a personal licence is issued.

Designation of premises

8. Except where otherwise authorised in a project licence (eg for field work at a specified place and time), any place where work is carried out under the Act must be designated as a scientific procedure establishment. Since January 1990, establishments which breed certain types of animal (including mouse, rat, guinea-pig, hamster, rabbit, dog, cat and primate) for use in scientific procedures ('breeding establishments'), and establishments which obtain such animals from elsewhere and supply them to laboratories ('supplying establishments') must have held a certificate of designation. Quail was added to the list of species in 1993. Designated establishments are required to nominate a person to be responsible for the day-to-day care of animals and a veterinary surgeon to advise on their health and welfare.

The Inspectorate

9. The Act gives statutory recognition to the Animals (Scientific Procedures) Inspectorate and describes the Inspectors' duties. Inspectors hold either medical or veterinary qualifications.
10. Inspectors assess all applications for new licences or amendments to existing licences in detail and advise the Department on how to ensure that only properly justified work is licensed. When assessing research proposals, the Inspectorate ensures that full consideration is given to alternatives, not only the replacement of procedures with others which do not use animals, but also the reduction of the number of animals used and the refinement of procedures to minimise pain and suffering. These are known as the **3Rs**. Inspectors carry out visits, mainly without notice, to establishments designated under the Act to inspect the premises and to ensure that the establishment's controls are adequate and that the terms and conditions of the licences issued under it are being observed.
11. Inspectors also advise the Department on policy matters connected with the operation of the Act and they are available to give advice and assistance to licensees and other personnel working under the Act.
12. During 2011 the Inspectorate made 117 visits to establishments.

The Animal Procedures Committee

13. The Act established the Animal Procedures Committee which has the duty of advising the Department and the Home Secretary on matters concerned with the Act and functions under it. The Department may refer matters to the Committee, but the APC is also free to consider topics of its own choosing. The Committee is required in its consideration of any matter to have regard both to the legitimate requirements of science

and industry and to the protection of animals against avoidable suffering and unnecessary use in scientific procedures. Each year, the Committee makes a report to the Department and the Home Secretary which is laid before Parliament and published.

14. The Act requires that, excluding the Chairman, the Committee must have a minimum of 12 members, one must be a lawyer and at least two thirds must be medical practitioners, veterinary surgeons or have qualifications or experience in a biological subject. At least half of the members must not have held a licence under the Act within the last six years. The Department must also ensure that animal welfare interests are adequately represented.

Guidance, Codes of Practice and Statistics

15. In addition to these annual statistics, the Act requires that there be published and laid before Parliament guidance on the operation of the controls of the Act and codes of practice as to the care and accommodation of animals and their use in regulated procedures. Four such documents have been published:

- Guidance on the operation of the Animals (Scientific Procedures) Act 1986 (2000; HC 321);
- Code of practice for the housing and care of animals used in scientific procedures (1989; HC 107);
- Code of practice for the housing and care of animals in designated breeding and supplying establishments (1995; HC 125); and
- Code of Practice for the Humane Killing of Animals under Schedule 1 to the Animals (Scientific Procedures) Act 1986 (1997; HC 193).

Education and training

16. The Animals (Scientific Procedures) Act 1986 imposes clear responsibilities on persons with specific roles in relation to the care and use of animals in scientific procedures. These are elaborated further in the Home Office guidance on the operation of the Act (HC 321, HMSO 2000) as mentioned above. As the roles differ, it follows that the education and training required before assuming these responsibilities will differ:
 - personal licence holders are responsible for the welfare of animals on which they carry out regulated procedures; applicants will be granted licences only if adequately trained to take on this responsibility and they will usually be required to work under supervision initially;
 - project licences will be issued only to persons with appropriate qualifications to direct a programme of work which is well-justified and takes account of all reasonable possibilities for reducing the number of animals used, refining the procedures to reduce suffering and replacing animal procedures with alternatives which do not involve protected animals;
 - holders of certificates of designation have responsibility not only for ensuring that the fabric and staffing of designated places are maintained to appropriate standards but also for ensuring that reasonable steps are taken to prevent unauthorised procedures being carried out and that adequate training facilities are available for all animal users.

17. Considerable progress has been made over recent years in providing appropriate training for those involved in research with animals. The training programmes for applicants for personal and project licences are described in Appendix IV of the Report of the Animals Procedures Committee for 1992 (Cm 2301, HMSO September 1993). All training programmes are accredited under a scheme recognised by the Department. Accreditation seeks to achieve common and high standards for licensee training which will facilitate free movement of licensees within the UK and Europe as well as ensuring high standards in the use of animals for scientific purposes.
18. Satisfactory completion of an accredited course prior to application for a personal licence has been a requirement under Departmental policy since 1 April 1994. The same requirement has applied to new applicants for project licences from 1 April 1995.
19. During 1995, mandatory training for Named Veterinary Surgeons was introduced and in 2004 mandatory training was introduced for Named Animal Care and Welfare Officers.

Performance against code of practice standards

20. The licensing team works to specific targets set out in its Code of Practice. The Code of Practice required new licences, certificates and amendments to be issued within 15 working days of receipt of the Inspectorate's recommendations. *(No targets have been, or indeed can be, set for the time the Inspectorate needs to consider applications. This depends greatly on the nature of the application: for example, consideration of a request for a new project licence for a complex and novel programme of work takes much longer than that for a replacement licence to continue ongoing non-complex work.)*
21. 290 licences, amendments and cancellations were processed during the year. One hundred percent (100%) were processed within the targets.
