## Key findings

- Excluding "walking for recreation", $54 \%$ had taken part in sport within the last year, a proportion that is comparable to the $52 \%$ reported in 2011/12.
However, when "walking for recreation" is included, participation rates increased from 63\% in 2011/12 to 68\% in 2012/13.
- A higher proportion of males (61\%) than females ( $46 \%$ ) participated in sport within the last year. However, when the "walking for recreation" category is included, the figures are similar (69\% of males; $66 \%$ of females).
- Less than a third of adults (32\%) normally achieve the Chief Medical Officers' recommendation of 150 minutes or more moderate intensity physical activity each week.
- Twenty-two per cent of the population were members of at least one sports club/ sports organisation, with males more likely to be members of at least one sports club (29\%) than females (14\%).
- Those living in the most deprived areas in Northern Ireland were less likely than those living in the least deprived areas to have participated in sport within the last 12 months, or the last 4 weeks, irrespective of the inclusion of the "walking for recreation" category.

Participation in sport in the last 12 months by deprivation

## Introduction

The Department of Culture, Arts and Leisure (DCAL) has responsibility for the development of sport and physical recreation in Northern Ireland. DCAL provides funding for sport, develops sport policy and supports sports initiatives.

DCAL promotes sport in the context of its strategy for sport, "Sport Matters: The Northern Ireland Strategy for Sport and Physical Recreation, 2009-2019". Sport Matters was developed by DCAL in partnership with Sport Northern Ireland and approved by the Northern Ireland Executive in December 2009.

Sport Matters contains a number of high level targets designed to improve levels and frequency of participation in sport and physical recreation across the Northern Ireland population that fit with the UK Chief Medical Officers' recommendations in relation to healthy physical activity. The targets aimed at adults and particular groups of people who are currently known to have lower participation rates in sport and physical recreation are set out below.

- To have stopped the decline of adult participation rates in sport and physical recreation by 2013.

By 2019, from the 2011 baseline, the following will be targeted.

- A minimum increase of 3 percentage points in adult participation rates in sport and physical recreation.
- A minimum increase of 6 percentage points in the participation rates of women, socio-economically disadvantaged groups, people with a disability and with older people in sport and physical recreation.

## Continuous Household Survey

The report presents data from the 2012/13 Continuous Household Survey (CHS) in relation to sports participation by the adult population in Northern Ireland. This information will be used in the monitoring of targets in Sport Matters.

More information relating to the Continuous Household survey, methodology and the interpretation of the figures can be found in the technical notes in Appendix 1. The data tables are included in Appendix 2 and the sports participation questions, which were asked in the CHS 2012/13, are included in Appendix 3.

## Sports participation in the last 12 months

Respondents to the 2012/13 CHS were presented with a list of 39 sports activities (Appendix 3) and asked which, if any, they had participated in within the last 12 months. The 2011/12 CHS was the first to include the "walking for recreation" as a sport, and this report presents analysis both including and excluding this category.

Overall, $54 \%$ had taken part in sport within the last year (excluding "walking for recreation"), a proportion that is comparable to the 52\% reported in 2011/12. However, when the "walking for recreation" category is included, a higher proportion (68\%) had taken part in a sport within the last year compared to the $63 \%$ reported in 2011/12.

## Gender

Comparing male and female participation rates, when the "walking for recreation" category is excluded, a higher proportion of males (61\%) than females (46\%) participated in sport within the last year. When the "walking for recreation" category is included, the figures are similar (69\% of males; $66 \%$ of females).

Figure 1a Sports participation in Northern Ireland in the last 12 months by gender

## Age

The proportion of people who participated in sport within the last year generally declined with age. The exception was the consecutive age groups 16-24, 25-34 and 35-44 when the "walking for recreation" category is included, with the proportion who had participated in sport within the previous year remaining fairly static at close to 80\% (Figure 1b). Comparing consecutive age groups from the 35-44 age group and beyond, sport participation declined between each consecutive age group whether or not "walking for recreation" was included in the analysis.

Figure 1b Sports participation in Northern Ireland in the last 12 months by age

## Marital Status

Considering marital status and regardless of whether or not "walking for recreation" is included in the analysis, single individuals were more likely to have participated in sport over the last year compared to individuals in any of the other marital status groups. Conversely, widowed individuals were the least likely to have participated in sport within the last year. Indeed, the four marital status groups analysed can be ranked in order of sports participation rates irrespective of the inclusion of the walking for recreation category as follows: single, married/ cohabiting, divorced/ separated and widowed.

Figure 1c Sports participation in Northern Ireland in the last 12 months by marital status

## Religion

There are no differences between the proportion of Catholics and the proportion of Protestants who have taken part in sport within the previous year regardless of whether or not the "walking for recreation" category is included in the analysis.

## Disability

Those who have a disability were less likely to have participated in sport over the last year than those who do not have a disability. A difference of 36 percentage points exists between the sport participation rates of these two groups, regardless of the inclusion of the "walking for recreation" category (Table 1).

## Dependants

Those with dependants were more likely to have participated in sport within the last 12 months than those who have no dependants ( $57 \%$ and $51 \%$ respectively). This difference exists also when the "walking for recreation" category is included (72\% and $65 \%$ respectively).

## Deprivation

Adults living in the most deprived areas in Northern Ireland were less likely to have participated in sport within the previous year than those living in the least deprived areas. When the "walking for recreation" category is excluded, $64 \%$ of those living in the least deprived areas participated in sport within the last year compared to under half ( $46 \%$ ) of those living in the most deprived areas. This difference is just as pronounced when "walking for recreation" is included with nearly four-fifths (79\%) of adults living in the least deprived areas participating in sport within the last 12 months, compared to three-fifths ( $60 \%$ ) of those living in the most deprived areas.

## Urban/ rural

Those living in rural areas were less likely to have participated in sport over the last year compared to those living in urban areas, a trend which was similar regardless of the inclusion of the "walking for recreation" category.

## Trends in sport participation

Looking at overall trends from 2007/08 and when the "walking for recreation" category is excluded, sports participation rates can be described as fairly stable ranging between $50 \%-54 \%$. Even though a significant decrease was noted between the years of 2007/08 (54\%) and 2008/09 (50\%), rates have returned to $54 \%$ in 2010/11 and again in 2012/13 (Figure 2).

The increase in overall sport participation rates when the "walking for recreation" category is included from 2011/12 (63\%) to 2012/13 (68\%) is evident among both those who live in urban and those who live in rural areas, amongst females, those aged $35-44$, single people, widowed people and those from the Protestant community (Table 2b).

Irrespective of the inclusion of the "walking for recreation" category in the analysis, there were increases in the sport participation rates of those aged 65 and over, those who do not have dependants and those who do not have a disability.

There was a decrease in the proportion of those who have a disability participating in sport within the last year when the walking for recreation category is excluded, falling from $32 \%$ in 2011/12 to $26 \%$ in 2012/13.

Figure 2 Sports participation in the last 12 months trend, 2007/08 to 2012/13

## Sports participation in the last 4 weeks

When the "walking for recreation" category is excluded, a third (33\%) of individuals had participated in sport in the last 4 weeks. Including this category, $59 \%$ had participated in sport within the last 4 weeks, an increase on the $53 \%$ reported in 2011/12.

A difference between the proportions of men and women participating in sport during the last 4 weeks exists, but only when the "walking for recreation" category is excluded from the analysis (44\% of males; $23 \%$ of females). When "walking for recreation" is included, around three-fifths of each sex had participated in sport during the last 4 weeks ( $60 \%$ of males; $58 \%$ of females).

There was a 35 percentage point difference in the proportion of women participating in sport during the last 4 weeks dependent on the inclusion of the walking for recreation category (58\% including "walking for recreation"; $23 \%$ excluding "walking for recreation"). Thus, for 35\% of women, walking for recreation was the only sport they had participated in during the previous 4 weeks ( $16 \%$ for men).

As with sports participation in the last 12 months, age, an individual's marital status, having a disability, living in a deprived area and having dependants were all related to whether or not a person has participated in sport during the last 4 weeks. However, there were some notable differences between both sets of analyses. With sport participation during the last 4 weeks there was:

- No difference between those who live in an urban and those who live in rural areas, regardless of the inclusion of the walking for recreation category.
- No difference between those who have dependants and those who do not have dependants when the walking for recreation category was excluded from the analysis.
- A difference between the 16-24 and 25-34 age groups when walking for recreation was excluded.

Experience of sport and physical activity by adults in Northern Ireland

Figure 3 Sport participation in the last 4 weeks

## Most popular sports

Walking for recreation was the most popular sport (44\%) with over twice the participation rate within the last 12 months than the next most popular category of swimming or diving ( $21 \%$ ). Keep-fit, aerobics, yoga, dance exercise (15\%), jogging (12\%) and cycling for recreation (12\%) make up the next three most popular sports. The top 5 most popular sports are the same as in 2011/12, but with a higher proportion of people taking part in walking for recreation ( $36 \%$ in 2011/12).

Nine of the top 10 most popular sports participated in are found in the top ten rankings for both males and females (Figures 4a, b and c). The notable difference is, that although football was the third most popular sport to participate in amongst males $(18 \%)$, for females, football is not in the top 20 , with badminton taking up tenth position in the female Ten (3\%).

Figure 4a Overall - Ten most popular sports participated in during the last 12 months

Figure 4b Males - Ten most popular sports participated in during the last 12 months

Figure 4c Females - Ten most popular sports participated in during the last 12 months

## Frequency and duration of sport and physical activity

Nearly three-fifths (59\%) of adults normally participate in sport and physical activity on one or more days per week, a figure which is similar for both males (60\%) and females (58\%). Twenty-two per cent of adults normally participated in sport and physical activity on 4 or more days per week (males: 23\%; females: $21 \%$ ).

Figure $5 \quad$ Number of days normally participate in sport and physical activity each week

## Chief Medical Officers' guidelines for physical activity

The Chief Medical Officers across the United Kingdom recommend that adults should take at least 150 minutes of moderate intensity physical activity each week. Less than a third of the population (32\%) achieved this target. There are differences between demographic groups when the proportion achieving this target is considered. Men (38\%) were more likely participate in 150 minutes or more of moderate intensity physical activity each week than women (27\%); those who do not have a disability ( $38 \%$ ) were more likely than those with a disability (15\%); and those who live in the least deprived areas (38\%) were more likely those who live in the most deprived areas (28\%).

Considering marital status, single people were the most likely of the marital status groups to achieve this target (37\%), while widowed people were least likely (16\%). There was no difference between married/ cohabiting (33\%) and the divorced/ separated categories (28\%).

The proportion of the population involved in 150 minutes or more of moderate intensity physical activity each week generally declined with age, with significant differences reported between the consecutive age bands of 35-44 (36\%) and 45-54 (30\%), and also the 55-64 (28\%) and 65 and over (20\%) age groups.

There was no difference in the proportion of the population involved in 150 minutes or more of moderate intensity physical activity each week when comparing those who live in an urban area (33\%) and those who live in a rural area (31\%); between those from the Catholic (31\%) or Protestant communities (32\%); or between those with dependants (31\%) and those who do not have dependants (33\%).

Figure 6 Achieving Chief Medical Officers' recommendation ${ }^{1}$

${ }^{1}$ The Chief Medical Officers across the UK have recommended 150 minutes or more moderate intensity physical activity each week for adults aged 19+ (Chief Medical Officers' recommendation on physical activity.

## Sport club/ sports organisation membership

Just over a fifth of the population (22\%) were members of at least one sports club. Males were over twice as likely (29\%) to be a member of a sports club than females (14\%).

Considering age and sports club membership, those aged 16-24 years were more likely to be a member of a sports club (32\%) than any other age group.

Single people were more likely to have membership of a sports club (27\%) than any other marital status group. Married people were the next most likely marital status group ( $21 \%$ ). There were no differences in sports club membership rates between divorced/ separated (16\%) and widowed individuals (13\%).

Those living in the least deprived areas were more likely to a member of a sports club (25\%) than those living in the most deprived areas (14\%); as were those who do not have dependants (24\%) compared to those who have dependants (18\%). People who do not have a disability were more likely to be members of a sports club (26\%) than those who have a disability (9\%). In addition, those living in rural areas (25\%) were more likely to be members of a sports club than those in living in urban areas (20\%).

Experience of sport and physical activity by adults in Northern Ireland

Figure $7 \quad$ Membership of at least one sports club

The most popular sports participated in at sports clubs included keep-fit, aerobics, yoga or dance exercise (5\%), weight training/ lifting/ body building (4\%) followed by golf (3\%).

Figure 8a Overall - Ten most popular sports clubs

For males, the most popular sports participated in at sports clubs were weight training/lifting/body building (5\%), golf (5\%), followed by football (5\%).

Figure 8b Males - Ten most popular sports clubs

For females, the most popular sports participated in at sports clubs was keep-fit, aerobics, yoga or dance exercise club (7\%), swimming or diving ( $2 \%$ ) followed by weight training/ lifting/ body building (2\%).

Figure 8c Females - Ten most popular sports clubs

## Benefits of participating in sport

Those who had participated in sport within the last year were presented with a list of 16 possible benefits of participation in sport (Appendix 3) and asked which they had experienced, if any. The most frequently cited benefits were to keep fit (71\%), improved health (56\%), improved my feeling of well-being (55\%) and to have fun (54\%).

Women were more likely than men to cite the following as a benefit of sport.

- Losing weight (females: $44 \%$; males: $35 \%$ )
- Improved feeling of well-being (females: 59\%; males: 52\%)

Men were more likely than women to cite the following as a benefit of sport.

- Have fun (males: 60\%; females: $49 \%$ )
- Opportunities to make new friends (males: $30 \%$; females: $21 \%$ )
- Mixing with people of different backgrounds (males: 28\%; females: 15\%)
- Developing skills as a team player (males: 19\%; females: 8\%)
- Learning new skills/ developing existing skills (males: 19\%; females: 11\%)
- Developing my confidence (males: 19\%; females: 15\%)
- Developing leadership skills (males: 12\%; females: $4 \%$ )

Figure 9 Ten most frequently cited benefits of participating in sport

## Reasons for not participating in sport or more sport

The most frequently cited reason for not participating in sport or more sport or physical activity was that individuals felt that they did not have enough time or that they would rather do other things with their time (35\%). More than one in every five respondents (22\%) stated that there was nothing that prevented them from participating in sport or more sport.

Women were more likely than men to cite then following as a reason for not participating in sport or more sport.

- I don't have enough time/ I would rather do other things with my time (females; 39\%; males: 30\%)
- I'm not interested in sport or physical activity (females; 18\%; males: 12\%)
- The weather is bad (females; 14\%; males: $10 \%$ )
- Taking part is expensive (females; 8\%; males: 6\%)
- I'm not good at sport or physical activity (females; 7\%; males: 4\%)
- I find sport boring (females; 5\%; males: 2\%)
- I find it embarrassing to exercise in front of people (females; 3\%; males: 1\%)

Men were more likely than women to state that there was nothing that prevented them from participating in sport or more sport (males; 28\%; females: 15\%).
"I'm not fit/ I get tired easily" was given as a reason for not participating in sport/ more sport or physical activity by equal proportions of both males and females (13\%).

Experience of sport and physical activity by adults in Northern Ireland

Figure 10 Ten most frequently cited reasons for not participating in sport or more sport

## Satisfaction with sports provision in Northern Ireland

Sixty-seven per cent of adults were either very satisfied or fairly satisfied with sports provision in Northern Ireland, with 8\% declaring that they were fairly or very dissatisfied.

Looking at sports provision satisfaction by those who had and had not participated in sport within the last year, a greater proportion of respondents who had participated in sport were fairly or very satisfied with sports provision (74\%) than those who had not participated in sport within the last year (53\%).

Figure 11 Satisfaction with sports provision by those who have and have not participated in sport ${ }^{1}$ in the last 12 months

1 "No sport" refers to those who had not participated in sport within the last year whereas "sport" refers to those who had.

## Experience of sport and physical activity by adults in Northern Ireland

## Targets for Sport Matters

The Continuous Household Survey (CHS) is used to help monitor a number of targets in Sport Matters. These are presented in the table below, while the targets are detailed in Appendix 4 (Page 49).

| Sport <br> Matter's <br> Target | CHS proxy statistic | 2009/10 | 2010/11 | 2011/12 \| | 2012/13 |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | \% | \% | \% | \% |
| PA4 | Participation in sport in the last 12 months | 51 | 54 | 52 | 54 |
| PA5 | Member of at least one sports club/ sports organisation | 21 | 23 | 22 | 22 |
| Normally participates in sports and physical activity on one or more days per week* |  |  |  |  |  |
| PA7 | All | 40 | 44 | 39* | 47 |
| PA8 | Females | 32 | 38 | 36* | 41 |
| PA9 | Living in the most deprived areas | 32 | 34 | 33* | 40 |
| PA9 | Social classes D and E | 27 | 33 | N/A | N/A |
| PA10 | Have a disability | 16 | 25 | 20* | 21 |
| PA11 | Aged 50 and over | 23 | 27 | 24* | 30 |

Participation statistics exclude those who had walked for recreation only within the previous 12 months.

* In 2011/12, the question changed from the 'number of days normally participated in sport and physical activity per week' to 'number of days participated in sport for 30 minutes or more , which was enough to raise your breathing rate, in the last week'. As a result, the figures are not comparable with 2011/12 and caution should be taken in drawing conclusions from the trend. The 2012/13 question has reverted back to that used for 2009/10 and 2010/11.

N/A (Not available)

## Appendix $1 \quad$ Technical notes

## Continuous Household Survey

The Continuous Household Survey (CHS) is a Northern Ireland wide household survey administered by Central Survey Unit, Northern Ireland Statistics and Research Agency. The 2012/13 survey was based on a random sample of 4,500 domestic addresses drawn from the Land and Property Services list of addresses and interviews were sought with all adults aged 16 and over in these households.

DCAL places questions related to sport and physical recreation annually in the CHS . The data derived from the CHS is used for various purposes: to monitor DCAL's Public Service Agreement targets, to help inform policy making, for equality monitoring and contributing to Northern Ireland wide strategies.

The findings reported in this bulletin are based on 3,625 responses from 2,684 households who answered the sports participation module of the survey. The questions relating to this section are included in Appendix 3.

## Weighting the DCAL module of the Continuous Household Survey (CHS)

Analysis of the DCAL module of the CHS is weighted for non-response in 2012/13. A chi square goodness-of-fit test showed that the CHS sample was not representative of the population by age and sex when compared with the Census 2011. As a result, three separate weights were produced for age, sex and age and sex combined.

Non-response weighting sometimes increases standard errors, although the impact tends to be fairly small, i.e. the adjustment may be less or greater than 1 , but will generally be reasonably close to 1 . In the case of the DCAL module of CHS, the values of the adjustment for all three weighting systems are so close to one, it is not necessary to take account of this in the calculation of standard error and confidence intervals.

While weighting for non-response (also called post-stratification) should reduce bias, it must be acknowledged that it will not eliminate bias. The reasons individuals choose to take part in surveys are complex and depend on lots of factors specific to the individual. As a result, the non-response biases in surveys are likely to be complex. Post-stratification works on the assumption that, by aligning the survey to the population along a small number of dimensions such as age and gender, many of these complex biases will reduce. However, it would be misleading to suggest that they will be eliminated.

Weights have been calculated and applied to previous years' CHS data from 2007/08 to allow trends to be produced for key statistics included in this bulletin.

## Comparison with other countries

It is not possible to compare sports participation in Northern Ireland with other parts of the United Kingdom or with the Republic of Ireland because the methodologies used are different.

## Statistical significance in this report

Any statements in this report regarding differences between groups such as males and females, different age groups, religion, etc., are statistically significant at the $95 \%$ confidence level. This means that we can be $95 \%$ confident that the differences between groups are actual differences and have not just arisen by chance. Both the base numbers and the sizes of the percentages have an effect on statistical significance. Therefore on occasion, a difference between two groups may be statistically significant while the same difference in percentage points between two other groups may not be statistically significant. The reason for this is because the larger the base numbers or the closer the percentages are to 0 or 100 , the smaller the standard errors. This leads to increased precision of the estimates which increases the likelihood that the difference between the proportions is actually significant and did not just arise by chance.

## Definition of disability

The questions used to ascertain whether or not a person has a disability have changed in the 2012/13 CHS in order to harmonise the definition of disability with the Equality Act 2010. This states that a disabled population is classified on the basis of having a long-lasting physical or mental health condition or illness which restricts day-to-day activities. The disabled population in this report are those who have answered yes to both the questions below:

- Do you have any physical or mental health conditions or illnesses lasting or expected to last for 12 months or more?
- Does your condition or illness / do any of your conditions or illnesses reduce your ability to carry out day to day activities?

In previous surveys, the disabled population was classified as those answering yes to the questions below:

- Do you have a long-standing illness, disability or infirmity? By long-standing I mean anything that has troubled you over a period of time or that is likely to affect you over a period of time.
- Does this illness or disability limit your activities in any way?

Although there are subtle differences between the two sets of questions, comparative analysis between years can be made.

## Northern Ireland Multiple Deprivation Measure, 2010

The data have been analysed by whether respondents are living in the 20\% most deprived Super Output Areas (SOAs) or in the 20\% least deprived areas. This is estimated using the Northern Ireland Multiple Deprivation Measure $2010^{1}$ which is a weighted combination of seven domains of deprivation. Rank 1 indicates the most deprived SOA, while rank 890 denotes the least deprived SOA.

[^0]
## Urban/ rural classification of Super Output Areas

The data have also been analysed by whether respondents are living in Super Output Areas (SOAs) that have been categorised as either urban or rural as set out in the Statistical Classification and Delineation of Settlements report (2005) ${ }^{2}$. This report classified each settlement in Northern Ireland into one of eight bands (A-H) and recommended that Government and other users should consider defining "urban" and "rural" areas in ways which are appropriate for different programmes and projects. In the absence of a programme-specific definition, Bands A-E can be defined as urban and Bands F-H as rural. This definition was applied in the analysis in this bulletin.

## Other notes

The following should be noted when interpreting figures and tables:

- Percentages less than $0.5 \%$ are denoted by ' 0 ' and where there are no responses, they are denoted by ' - '.
- Percentages may not add to $100 \%$ due to rounding.
- Percentages may not add to $100 \%$ for questions where multiple responses are allowed.
- Detailed tabulations are not provided where the number of respondents is too small to allow meaningful analysis.
- The base number of responses to each question, which is shown in each table, may vary due to some respondents not answering certain questions.

[^1]
## Appendix 2 Data tables

Table $1 \quad$ Participation in sport in the last 12 months

| Profile of respondent | 2012/13 |  |  |
